The Contractor shall ensure that the cable bends maintain the proper minimum bend radius during installation. The fiber optic cable shall be pulled in the conduit with a split mesh cable grip designed to provide a firm hold on the exterior covering of the cable. Cable shall not be pulled over or along the ground, around edges or corners, over or around obstructions, or through unnecessary curves or bends. The Contractor shall ensure that the tensile load on the cable does not exceed the manufacturer’s recommended maximum by using a pulley system with a numerical readout of the actual tension on the cable and includes a means of alerting the installer when the pulling tension approaches the manufacturer’s maximum recommended pulling tension or 600 lbs., whichever is less. The contractor shall supplement this procedure with a breakaway tension limiter set below the lowest recommended tensile limit of the cables being pulled.

Air-assisted fiber optic cable installation techniques shall be an acceptable alternative to pulling cable. The Contractor shall be responsible for ensuring that the installed conduits are coupled correctly and that the conduit can maintain the required pressure. Lubrication used by the Contractor for cable installation shall be specifically engineered for blowing applications and typical pulling lubricants will not be permitted.

Under no circumstances shall the fiber optic cable be cut or spliced at intermediate points without written permission by the Engineer. The Contractor shall only splice fibers at existing and proposed splice closures as shown on the splice diagrams with the Plans. In the traffic signal cabinets, fibers shall be terminated at fiber optic interconnect units. Lateral/spur cables shall be installed using appropriate strain relief.

When pulling cable in both directions from the mid-point of a run, the Contractor shall first pull one-half of the cable from the reel at the mid-point through the conduit to one end of the run. The other half of the cable shall be removed from the reel and carefully placed on the ground. The cable shall be coiled in a figure eight with a minimum loop diameter of 10 times the cable diameter. Cardboard shims (or equivalent method) or additional figure-eight shall be used to relieve pressure on the cable at crossovers. The coiled cable shall then be pulled through the conduit to the other end of the run. The Contractor shall not kink, twist, or bend the cable during installation coiling or uncoiling.

During pulling, the cable shall be continuously lubricated as it enters the conduit. Lubricant shall be that recommended by the cable manufacturer. Liquid dishwashing or laundry detergents shall not be used.

At each splice point, the Contractor shall coil or figure-eight the slack fiber optic cable. Unused fibers shall remain un-spliced in a splice closure and reserved for future use.

Loops or figure-eight, 50 feet of slack shall be provided in each pull box that is identified in the plan set.

Terminations at the Patch Panel within the building shall be LC Connector terminations.

Pre-Installation Fiber Testing (On-Reel)

A pre-installation fiber test shall be performed on every reel of fiber for cable acceptance prior to installation. The test shall be used to evaluate the integrity, overall length, and fiber attenuation of the received cables. The test results shall be provided to the Engineer to assist in comparing the received cable to these Special Provisions, uncover point defects due to handling during transport and effectively measure un-terminated fibers. Except for the cable and access to test each reel of fiber, the Contractor shall preserve the cable in its originally shipped condition in the event the pre-installation testing indicates flaws in the fiber and the reel has to be returned for a replacement. In the event that the Engineer fails to notice a problem(s) in the pre-installation fiber test for a specific reel of fiber, the installation of that reel of fiber by the Contractor shall indicate that the Contractor assumes all risk for all material, equipment and labor costs associated with removal and replacement of the fiber at no additional cost to the City.

Fiber Optic Sub-System Testing

A test plan shall be generated by the Contractor and must be reviewed and approved by the Engineer. The test plan shall identify procedures to ensure quality fiber optic by the Engineer. The test plan shall identify procedures to ensure quality fiber optic system construction but must minimize any operational impact to the traffic signal control system and related City networks. At a minimum, the Contractor should identify the following:

- List of fiber optic system equipment installed under this Contract.
- Fiber system equipment setup
- Control settings
- Test equipment calibration and certification per the following standards:

- TIA-455-231 TIA-455-231 Calibration of Fiber Optic Power Meters
- TIA/EIA-455-226 Calibration of OTDRs
- Testing procedure
- Expected results.
