Faircloud Subdivision, Filings II & III

At your request, on February I, 2001, we observed the soil conditions in the foundation excavation at the above referenced address. The purpose of our work was to determine if fill of an unknown nature, or if soft virgin soils are present below the proposed footings. This is a requirement of City of Grand Junction Planning Commission, Final Decision FPP-1999-280.

At the time of our visit, the foundation area had been excavated in preparation for a monolithic slab. The

Myself, accompanied by soils lab technicians, hand-augered two test holes within the proposed building location. Holes were augered three to four feet in depth and located on the East and West sides of the excavation.

The soils were non-expansive, slightly moist, and comprised of native light brown silty clay with sand. Soil type and gradation was consistent throughout the augered depth.

Our visual observations indicated that no unknown fill or soft soil conditions are present.

If you have any questions or if we may be of further assistance, please do not hesitate to contact us.

Respectfully Submitted:
WESTERN COLORADO TES

Michael J. Weigand, P.E.
