CITY COUNCIL AGENDA
WEDNESDAY, FEBRUARY 20, 2019
250 NORTH 5TH STREET
5:15 PM – PRE-MEETING – ADMINISTRATION CONFERENCE ROOM
6:00 PM – REGULAR MEETING – CITY HALL AUDITORIUM

To become the most livable community west of the Rockies by 2025

Call to Order, Pledge of Allegiance, Moment of Silence

Proclamations

Proclaiming February 23, 2019 as National TRiO Day in the City of Grand Junction

Proclaiming February 24 - March 2, 2019 as Peace Corps Week in the City of Grand Junction

Proclaiming The City of Grand Junction an Inclusive City

Appointments

To the Planning Commission/Zoning Board of Appeals

Citizen Comments

Individuals may comment regarding items scheduled on the Consent Agenda and items not specifically scheduled on the agenda. This time may be used to address City Council about items that were discussed at a previous City Council Workshop.

City Manager Report

Council Reports

CONSENT AGENDA

The Consent Agenda includes items that are considered routine and will be approved by a single motion. Items on the Consent Agenda will not be discussed by City Council, unless an item is removed for individual consideration.

1. Approval of Minutes

a. Summary of the February 4, 2019 Workshop

b. Minutes of the February 6, 2019 Executive Session

c. Minutes of the February 6, 2019 Regular Meeting

2. Set Public Hearings

All ordinances require two readings. The first reading is the introduction of an ordinance and generally not discussed by City Council. Those are listed in Section 2 of the agenda. The second reading of the ordinance is a Public Hearing where public comment is taken. Those are listed below.

a. Quasi-judicial

i. A Resolution Referring a Petition to the City Council for the Annexation of Lands to the City of Grand Junction, Colorado, Setting a Hearing on Such Annexation, Exercising Land Use Control, and Introducing Proposed Annexation Ordinance for the Hosanna Annexation of 5.722 Acres, Located at 743 24 ¾ Road and Set a Public Hearing for April 3, 2019

ii. Introduction of an Ordinance Amending Ordinance No. 4508 for the Planned Residential Development - North 7th Street to Disallow the Use of Vinyl Fencing on Properties Within the District and Set a Public Hearing for March 20, 2019

iii. Introduction of an Ordinance Zoning the South Twenty Annexation R-4 (Residential - 4 du/ac) and R-8 (Residential - 8 du/ac), Located at 2335 H Road and Set a Public Hearing for March 6, 2019

iv. Introduction of an Ordinance Vacating a Portion of the Dos Rios Drive and C 3/4 Road Right-of-Way Within the Jarvis Subdivision Plat, Located at 2595 Riverside Parkway, and Set a Public Hearing for March 6, 2019

v. Introduction of an Ordinance Establishing an Institutional and Civic Master Plan for the Grand Junction Regional Airport, Amending Ordinance No. 3679 for Planned Development and Outline Development Plan and Vacating a Portion of the 27 1/4 Road Right-of-Way Adjacent to Airport Property, and Set a Public Hearing for March 6, 2019

vi. Introduction of a Proposed Ordinance Rezoning Two Properties from M-U (Mixed Use) to C-2 (General Commercial) Located at 746 23 ½ Road and Set a Public Hearing for March 6, 2019

vii. Introduction of an Ordinance Vacating a Portion of the Kimball Avenue Right-of-Way and a Portion of a Multi-Purpose Easement, along Properties Located at 1015 and 1101 Kimball Avenue and Set a Public Hearing for March 6, 2019

viii. Introduction of a Proposed Ordinance Rezoning Two Properties from R-16 (Residential 12-16 du/ac) to R-24 (Residential 24+ du/ac) Located at 1213 North 15th Street and 1420 Glenwood Avenue and Set a Public Hearing for March 6, 2019

ix. A Resolution Referring a Petition to the City Council for the Annexation of Lands to the City of Grand Junction, Colorado, Setting a Hearing on Such Annexation, Exercising Land Use Control, and Introducing Annexation Ordinance for the Arlington Annexation, which is a Serial Annexation Consisting of Arlington Annexation No. 1 and Arlington Annexation No. 2, Totaling 1.41 acres, Located at 265 Arlington Drive and Set a Public Hearing for April 3, 2019

3. Continue Public Hearings

a. Quasi-judicial

i. Continue the South Twenty Annexation request until the March 6, 2019 City Council Meeting

4. Contracts

a. Contract to Provide Dump Trucks and Drivers for Spring Cleanup 2019

5. Resolutions

a. A Resolution Vacating a Public Utility Easement on Property Located at 2626 Cottonwood Drive

6. Other Action Items

a. Consider a Request by GJ Ute LLC, to Accept the Dedication of 8.79-acres of Open Space in the Proposed Emerald Ridge Estates, Filing 1 Subdivision

REGULAR AGENDA

If any item is removed from the Consent Agenda by City Council, it will be considered here.

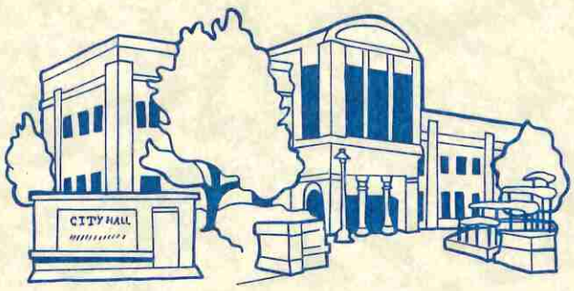
7. Resolutions

a. Agreement with Powderhorn Ski Company, LLC. to Lease Water for Snowmaking

8. Public Hearings

a. Legislative

i. An Ordinance Amending the Municipal Code Regarding Possession or Consumption of Alcohol in Parks and Riverfront Trails, Changing the Hours of Prohibited Park Use, and Including Vaping and the Use of Vape Devices as Prohibited in Workplaces, Public Places, and for Use by Minors



ii. An Ordinance to Amend Chapters 12.04 and 12.08 of the Grand Junction Municipal Code and Section 21.06.010 of the Zoning and Development Code Regarding Camping on Public Property/Public Places

9. Non-Scheduled Citizens & Visitors

This is the opportunity for individuals to speak to City Council about items on tonight's agenda and time may be used to address City Council about items that were discussed at a previous City Council Workshop.

10. Other Business

11. Adjournment

City of Grand Junction, State of Colorado

Proclamation

Whereas, TRiO, a collection of federally funded programs designated to prepare low-income and first-generation students (students from families whose parents do not have a four-year college degree) for college success, was founded in 1964; and

Whereas, TRiO refers to the first three programs of this nature that fell under the Higher Education Amendments of 1968, Upward Bound, Talent Search, and a program now known as Student Support Services; and

Whereas, the TRiO program, with the help of students, staff, and community members, has grown to eight programs that help students seek higher education; and

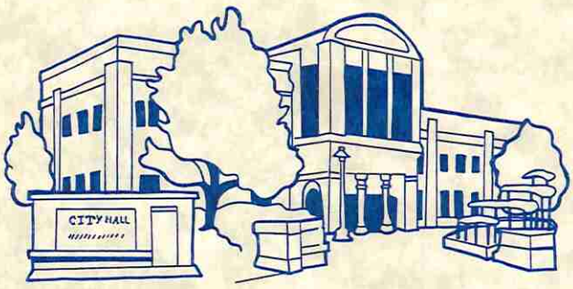
Whereas, the TRiO programs provide opportunities and access to services that assist students in their academic journey; and

Whereas, the TRiO Student Support Services Program at Colorado Mesa University served more than 150 students during the 2017-2018 school year with 86% returning to continue their education; and

Whereas, 94% of Colorado Mesa University TRiO students maintain good academic standing; and

Whereas, National TRiO Day is a day to celebrate its positive impact on local communities and the nation, to reflect on the importance of education, and a time to act to protect further access to higher education

NOW, THEREFORE, I, Barbara Traylor Smith, by the power vested in me as Mayor of the City of Grand Junction, do hereby proclaim February 23, 2019 as



"National TRiO Day"

in the City of Grand Junction and urge all the citizens of the City to turn its attention to and increase awareness of the needs of disadvantaged young people and adults aspiring to improve their lives.

IN WITNESS WHEREOF, I have hereunto set my hand and caused to be affixed the official Seal of the City of Grand Junction this 20th day of February, 2019.

Mayor

City of Grand Junction, State of Colorado

Proclamation

Whereas, the Peace Corps has become an enduring symbol of our nation's commitment to encourage progress, create opportunity, and expand development at the grass roots level in the developing world; and

Whereas, over 225,000 Americans have served as Peace Corps Volunteers and trainees in 140 host counties since 1961; and

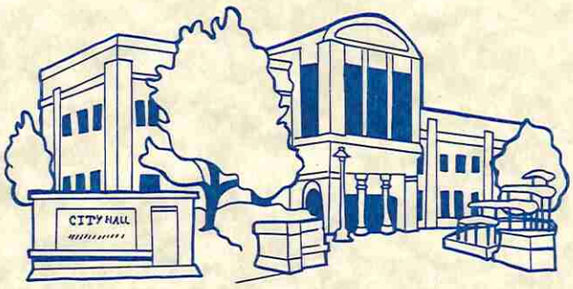
Whereas, in 2016, 24,000 individuals volunteered for the Peace Corps and 3,800 were deployed; and

Whereas, Peace Corps Volunteers have made significant and lasting contributions around the world in agriculture, food security, business and civil society development, information technology, education, health and HIV/AIDS care and prevention, youth and community development, and the environment and have improved the lives of individuals and communities around the world; and

Whereas, Peace Corps Volunteers have strengthened the ties of friendship between the people of the United States and those of other countries, and they have been enriched by their experiences overseas, have brought their communities throughout the United States a deeper understanding of other cultures and traditions, thereby bringing a domestic dividend to our nation; and

Whereas, returning Peace Corps Volunteers nationwide are celebrating Peace Corps Week honoring the agency's anniversary.

NOW, THEREFORE, I, Barbara Traylor Smith, by the power vested in me as Mayor of the City of Grand Junction, do hereby proclaim February 24 – March 2, 2019 as Peace Corps Week



"National Peace Corps Week"

in the City of Grand Junction and urge all the citizens of the City to turn its attention to Commemorating President John F. Kennedy's establishment of the agency on March 1, 1961, and celebrating all the ways that Peace Corps makes a difference at home and abroad.

IN WITNESS WHEREOF, I have hereunto set my hand and caused to be affixed the official Seal of the City of Grand Junction this 20th day of February, 2019.

_____

Mayor

City of Grand Junction, State of Colorado

Proclamation

Whereas, Grand Junction, CO is a city that welcomes and celebrates people of all races, ethnicities, religions, sexual orientations, genders, economic status and physical and mental circumstances. The City of Grand Junction cherishes our diversity and believes it enhances the quality of life in our community; and

Whereas, Grand Junction respects diversity and desires to ensure that the human rights of all citizens are protected and to that end the City implores all citizens to make known that we do not tolerate discrimination in any form and recognize that marginalized individuals experience increased instances of bias, hate speech, bigotry and violence through no fault of their own; and

Whereas, the residents of Grand Junction are urged to work together to engage in dialogue and move forward to ensure all Grand Junction residents feel their voices are heard, and to ensure that our community will foster equality, social justice and freedom from fear of persecution based on race, religious belief, country of origin, sexual orientation, gender, income, disability, age or family status; and

Whereas, the residents of Grand Junction are urged to expand community outreach, engagement and authentic collaboration that will empower each Grand Junction resident with the ability and desire to help create a society that condemns racism, misogyny, intolerance, discrimination or oppression toward any person.

NOW, THEREFORE, the Grand Junction City Council commits to support, participate in and help expand inclusivity conversations in support of a community that is free of oppression, persecution and hate. **FURTHERMORE**, the City of Grand Junction hereby intends to annually recognize the importance of inclusion of all residents of all beliefs and to consider, respect and value the uniqueness and importance of diversity in our community.

"The City of Grand Junction an Inclusive City"

IN WITNESS WHEREOF, I have hereunto set my hand and caused to be affixed the official Seal of the City of Grand Junction this 20th day of February, 2019.

GRAND JUNCTION CITY COUNCIL WORKSHOP SUMMARY
February 4, 2019

Meeting Convened: 5:30 p.m. in the City Hall Auditorium

Meeting Adjourned: 6:46 p.m.

City Councilmembers present: Councilmembers Duncan McArthur, Phyllis Norris, Rick Taggart, and Duke Wortmann.

Staff present: City Manager Greg Caton, City Attorney John Shaver, Public Works Director Trent Prall, Community Development Director Tamra Allen, Principal Planner Dave Thornton, Community Services Manager Kathy Portner, Development Engineer Jarrod Whelan, Assistant to the City Manager Greg LeBlanc, and City Clerk Wanda Winkelmann.

Agenda Topic 1. Discussion Topics

a. Selection of members for the 2020 Comprehensive Plan Advisory Committee (CPAC)

Mr. Thornton introduced the topic. The City will be conducting the 2020 Comprehensive Plan update over the next 18 months. The Comprehensive Plan (last updated in 2010) is a long-range plan that looks at where and how the city will grow over the next 20 years. As a part of this effort, the consultant for the Comprehensive Plan, Houseal Lavigne, recommended appointing a committee of 12 to 15 members to serve as a sounding board, meet at key points during the project to discuss overall planning direction, review project deliverables, vet ideas and help promote community involvement.

Staff solicited letters of interest from the community to serve on the Comprehensive Plan Advisory Committee (CPAC); 44 letters of interest were received. After Council reviews the letters of interest, formal appointment of the CPAC has been scheduled for the February 6th Council Meeting.

Discussion ensued regarding the applications and the following individuals were recommended appointees to the CPAC: Cindy Enos-Martinez, Diane Schwenke, Doug Sorter, Merritt Sixbey, Mike Foster, Robin Brown, Vara Kusal, Ivan Geer, Sister Karen Bland, Bethany Meyer, Gary Schroen, Ted Ciavonne, and Ben Herman. It was also recommended that a member of the Grand Junction Planning Commission (Keith Ehlers) and Mesa County Planning Commission be added to the Committee.

There will be additional opportunities for involvement in this process over the next 18 months.

b. Update on the Downtown Development Authority Plan of Development (POD)

Allison Bourquin with Community Builders and Brandon Stam, Director of the Downtown Development Authority introduced the topic.

The Downtown Development Authority (DDA) Plan of Development (POD) adopted in 1981 is 38 years old and needs to be updated in order to guide development that is reflective of both the current market or the vision of the community for the greater downtown area. In this time of growth, the DDA should have a governing document that is reflective of the community's wants and needs in downtown and provides guidance about developing important partnerships for making a positive impact to the downtown. This project will develop an action-oriented plan for the DDA that identifies strategies and specific projects to achieve the community's priority goals for downtown Grand Junction.

Ms. Bourquin reviewed the results of an online survey and comments received at community events, comment boxes, and focus groups. Ms. Bourquin reviewed the retail potential of downtown and noted 82% of survey respondents go downtown at least once a week. Most respondents would like to see more shopping and dining downtown. Economic, housing, identity, connectivity, and comfort related themes emerged from the survey.

Discussion ensued about the experiential element of dining and shopping downtown, the possibility of DDA creating partnerships with others for pedestrian connections, and façade and ADA improvements in downtown.

The next steps include strategic goals workshops and learning events on February 26-27. A Phase 1 and 2 Summary Report will be forthcoming.

Agenda Topic 2. Next Workshop Topics

The February 18 workshop is canceled due to the Presidents Day holiday.

3. Other Business

There was none.

Adjournment

The Workshop adjourned at 6:46 p.m.

GRAND JUNCTION CITY COUNCIL

SPECIAL SESSION MINUTES

February 6, 2019

The City Council of the City of Grand Junction, Colorado met in Special Session on Wednesday, February 6, 2019 at 5:00 p.m. in the Administration Conference Room, 2nd Floor, City Hall, 250 North 5th Street. Those present were Councilmembers Chris Kennedy, Duncan McArthur, Phyllis Norris, Duke Wortmann, and Mayor Barbara Traylor Smith via phone.

Staff present for the Executive Session were City Manager Greg Caton, City Attorney John Shaver, Utilities Director Randi Kim, and Public Works Director Trent Prall.

Councilmember Kennedy moved to go into Executive Session to discuss matters that may be subject to negotiations, developing strategy for negotiations, and/or instructing negotiators pursuant to Sections 24-6-402 (4)(e) and 24-6-402 (4)(a) of Colorado's Open Meetings Law relative to an interest(s) in real property and/or purchase or acquisition of rights for construction and maintenance of a portion of the 23 Road Trunkline Sewer and we will not be returning to open session. Councilmember Norris seconded the motion. Motion carried unanimously.

The City Council convened into Executive Session at 5:06 p.m.

Councilmember Wortmann moved to adjourn. Councilmember McArthur seconded. Motion carried unanimously.

The meeting adjourned at 5:30 p.m.

Wanda Winkelmann
City Clerk

GRAND JUNCTION CITY COUNCIL
MINUTES OF THE REGULAR MEETING

February 6, 2019

The City Council of the City of Grand Junction convened into regular session on the 6th day of February, 2019 at 6:00 p.m. Those present were Councilmembers Chris Kennedy, Duncan McArthur, Phyllis Norris, Duke Wortmann, and Council President Barbara Traylor Smith (via phone). Councilmembers Bennett Boeschenstein and Rick Taggart were absent. Also present were City Manager Greg Caton, City Attorney John Shaver, City Clerk Wanda Winkelmann and Deputy City Clerk Janet Harrell.

Council President Traylor Smith called the meeting to order. Councilmember McArthur led the Pledge of Allegiance which was followed by an invocation by Landmark Baptist Church Pastor Tom Barlament.

1. Resolutions

a. Resolution Authorizing a City Council Acting President Pro Tem

The Mayor and the Mayor Pro Tem will both be absent from the City at the same time and the City Council determined the appointment of an acting Mayor Pro Tem is necessary.

Councilmember Kennedy moved to adopt Resolution No. 10-19, a resolution appointing an acting President Pro Tempore of the City Council as Councilmember Phyllis Norris. Councilmember Wortmann seconded the motion. Motion carried unanimously by roll call vote.

Appointments

Appointment of Members to the 2020 Comprehensive Plan Advisory Committee

The City will be conducting the 2020 Comprehensive Plan update over the next 18 months. As a part of this effort, a Comprehensive Plan Advisory Committee (CPAC) will be established to provide input on the Plan. City Council will appoint 12 to 15 people from a list of applicants that were discussed by Council at the Monday, February 4th Council Workshop. Council recommended the following applicants to the CPAC: Cindy Enos- Martinez, Diane Schwenke, Doug Sorter, Merritt Sixbey, Mike Foster, Robin Brown, Vara Kusal, Ivan Geer, Karen Bland, Bethany Meyer, Gary Schroen, Ted Ciavonne, Ben Herman, Keith Ehlers (City of Grand Junction Planning Commissioner) and Mesa County Planning Commissioner to be determined.

Councilmember Wortmann moved to appoint the Council's list of recommended committee members to the Comprehensive Plan Advisory Committee. Councilmember McArthur seconded the motion. Motion carried unanimously by voice vote.

Certificates of Appointment

To the Urban Trails Committee

Stephen Meyer accepted his Certificate of Appointment.

Citizen Comments

Judi DeRusha, President of Amalgamated Transit Union #1776 and who works for TransDev Transportation (operates Grand Valley Transit), spoke about local wages.

Chris Riley, President of Grand Mesa Little League, spoke about the trash and debris that is often left at the park.

City Manager Report

City Manager Caton invited everyone to the Lincoln Park Golf Pro Shop Open House on February 22nd.

Council Reports

Councilmember Kennedy requested Chris Riley's concerns regarding Grand Mesa Little League Park be addressed by staff.

CONSENT AGENDA

Acting Council President Pro Tem Norris announced Consent Agenda item 4.c. will be continued to the February 20, 2019 regular City Council meeting.

Councilmember Kennedy moved to adopt Consent Agenda items #2 through #4.b., #4.d. and #5. Councilmember Wortmann seconded the motion. Motion carried unanimously by roll call vote.

2. Approval of Minutes

a. Summary of the January 14, 2019 Workshop

b. Minutes of the January 16, 2019 Regular Meeting

c. Minutes of the January 28, 2019 Special Meeting

3. Set Public Hearings

a. Quasi-judicial

i. Introduction of an Ordinance Zoning the South Twenty Annexation R-4 (Residential - 4 du/ac) and R-8 (Residential - 8 du/ac), Located at 2335 H Road, and Setting a Hearing for February 20, 2019

4. Contracts

a. Purchase of a Medium-Duty Ambulance

b. Purchase of Type 3 Wildland Fire Engine

c. Purchase of Two (2) Fire Pumper Trucks – *continued to February 20, 2019*

d. Authorize a Contract with Houseal Lavigne Associates for Development of the Comprehensive Plan

5. Resolutions

a. Resolution Approving the Notice of Election for the Regular Municipal Election April 2, 2019

REGULAR AGENDA

6. Public Hearings

a. Legislative

i. An Ordinance Amending Parts of the Zoning and Development Code Regarding Performance Standards of Zoning Districts, Accessory Dwelling Units, Flag Lots, Architectural Standards Relating to Garage Doors so as to Eliminate Unnecessary Regulation and Resolve Inconsistencies

This request is to amend various sections of the Zoning and Development Code to eliminate requirements that have been proven, over time, to be impractical, difficult or impossible to apply or enforce, and for which there are other safeguards in the Code furthering the intent of the provisions, inconsistencies within the Code, unnecessary regulations or duplicate information.

Community Services Manager Kathy Portner reviewed the request.

Discussion included setbacks for side entry garages, side street monument signs and flag lots.

The public hearing opened at 6:27 p.m.

There were no public comments.

The public hearing closed at 6:28 p.m.

Councilmember Kennedy moved to adopt Ordinance No. 4831, an ordinance amending parts of the Zoning and Development Code regarding performance standards of Zoning Districts, accessory dwelling units, flag lots, architectural standards relating to garage doors so as to eliminate unnecessary regulation and resolve inconsistencies on final passage and ordered final publication in pamphlet form. Councilmember Wortmann seconded the motion. Motion carried unanimously by roll call vote.

7. Non-Scheduled Citizens & Visitors

Dana Martinez said Grand Valley Transit employees have gotten awards and strive to be perfect.

8. Other Business

There was none.

9. Adjournment

The meeting adjourned at 6:31 p.m.

Grand Junction City Council

Regular Session

Item #2.a.i.

Meeting Date: February 20, 2019

Presented By: David Thornton, Principal Planner

Department: Community Development

Submitted By: David Thornton, AICP
Principal Planner

Information

SUBJECT:

A Resolution Referring a Petition to the City Council for the Annexation of Lands to the City of Grand Junction, Colorado, Setting a Hearing on Such Annexation, Exercising Land Use Control, and Introducing Proposed Annexation Ordinance for the Hosanna Annexation of 5.722 Acres, Located at 743 24 ¾ Road and Set a Public Hearing for April 3, 2019

RECOMMENDATION:

Staff recommends adoption of a resolution referring the petition for the Hosanna Annexation, introducing the proposed Ordinance and setting a hearing for April 3, 2019.

EXECUTIVE SUMMARY:

The Applicant, Bonny J. Collins Trust, has requested annexation of their 5.72 acres located at 743 24 ¾ Road. The proposed annexation includes no Right-of-Way and currently has a single family residential home on it. The owner is requesting annexation for future residential subdivision development of the property, which is anticipated to constitute "annexable development" and as such is required to annex in accordance with the Persigo Agreement. Consideration for zoning of this annexation will be heard in a future action.

BACKGROUND OR DETAILED INFORMATION:

The Hosanna annexation consists of one 5.72-acre parcel of land located at 743 24 ¾ Road, located at the north end of Monument View Drive. The property currently has

one single family residence. The Applicant plans to subdivide the property into 30 residential lots with the existing residence on one of those lots and is requesting annexation at this time in anticipation of this development. The Applicant is requesting a R-8 (residential with a maximum of 8 units per acre) zone district. The property is located at the north end of Monument View Drive which stubs into this property. Zoning will be considered in a future action and requires review and recommendation by the Planning Commission.

The property is adjacent to existing city limits, within the Persigo 201 boundary and is annexable development as defined in the Persigo Agreement. Under the 1998 Persigo Agreement with Mesa County, all proposed development within the Persigo Wastewater Treatment Facility boundary requires annexation by the City. The property owner has signed a petition for annexation of the property. There is no Right-of-Way being annexed as part of this annexation.

Staff has found, based on review of the petition and knowledge of applicable state law, including the Municipal Annexation Act Pursuant to C.R.S. 31-12-104, that the Hosanna Annexation is eligible to be annexed because of compliance with the following:

a) A proper petition has been signed by more than 50% of the owners and more than 50% of the property described;

b) Not less than one-sixth of the perimeter of the area to be annexed is contiguous with the existing City limits;

c) A community of interest exists between the area to be annexed and the City. This is so in part because the Central Grand Valley is essentially a single demographic and economic unit and occupants of the area can be expected to, and regularly do, use City streets, parks, and other urban facilities;

d) The area is or will be urbanized in the near future;

e) The area is capable of being integrated with the City;

f) No land held in identical ownership is being divided by the proposed annexation;

g) No land held in identical ownership comprising 20 contiguous acres or more with an assessed valuation of $200,000 or more for tax purposes is included without the owner’s consent.

The proposed annexation and zoning schedule with a summary is attached.

FISCAL IMPACT:

The provision of municipal services will be consistent with adjacent properties already in the City. Property tax levies and municipal sales/use tax will be collected, as applicable, upon annexation. More specific impacts to various service providers of the City include the following.

Police Department:
Upon review of 2017 and 2018 calls for service within the surrounding area which is similar in residential density, data revealed that there were 111 calls for service in 2017 and 100 calls for service in 2018. Based on that information it is anticipate that calls for service by GJPD for this location will equal to 12.5% of an officer. At this point, it does not warrant the need for an increase in personnel or equipment in order to provide law enforcement services to this proposed annexation. However, this annexation along with any future annexations/developments will no doubt have an eventual cumulative impact that will require an increase in law enforcement personnel and equipment in order to provide adequate services.

Public Works:
There are no external streets being annexed, therefore there are no financial impacts from the annexation. Transportation Capacity Payment (TCP) fees will be collected at the time of subdivision of the property.

Fire:
The provision of municipal services will be consistent with adjacent properties already in the City. Property tax levies and municipal sales/use tax will be collected, as applicable, upon annexation. Based on the current assessed values of the annexation area, the City property tax revenue is estimated to be $203 annually. If the property develops at an estimated 31 units, including 17 single family detached, three single family attached and two eight unit 4-plex units for an estimated value of $6.8 million, the estimated annual property tax revenue (at the current residential assessment rate) would be approximately $3,900 per year. Sales and use tax revenues will be dependent on construction activity and consumer spending on City taxable items for residential and commercial uses.

Currently the property is in the Grand Junction Rural Fire Protection District (Rural District) which is served by the Grand Junction Fire Department through a contract with the Rural District. The Rural District collects a 5.938 mill levy that generates $150.94 per year in property taxes that are passed on to the City of Grand Junction per the contract. If annexed, the Rural District mill levy will be removed and the City's 8 mills that will generate $203 per year (prior to development) and $3,900 per year after estimated planned development which will need to pay for not only fire and emergency medical services, but also other City services provided to the area. City services as

discussed below are supported by a combination of property taxes and sales/use taxes.

The fire department has only responded once to this location in the last 10 years and with an estimated build out of 31 units the increase in incident volume will be minimal. The area is served by Fire Station #3 however response times are longer than other areas due to the distance from the fire station. Response time is estimated to be 6-8 minutes from time of dispatch for an emergent call for service, which is longer than National Fire Protection Association response time standards. The City has been working to address the current and future fire and EMS coverage demands of this area and is planning for a new Fire Station at 23 and H Road.

Parks:
There are no financial impacts to Parks with this annexation. Parks and Recreation fees and Open Space fees will be collected with the future subdivision of this property.

Utilites:
Water and sewer services are available to this property. This property is within the Ute Water District service area. The property is currently within the Persigo 201 Sewer Service Area. However, the property does not currently have a sewer connection. The property would be assessed the current plant investment fee (PIF) of $4,776 per equivalent unit (2019 rate) or $396,408. This fee is intended to pay the equivalent share of the payments due on bonds for the existing wastewater treatment plant and infrastructure. Monthly sewer service rates for single family units are $22.40.

SUGGESTED MOTION:

I move adopt Resolution No. 11-19, a resolution referring a petition to the City Council for the annexation of lands to the City of Grand Junction, Colorado, setting a hearing on such annexation, and exercising Land Use Control, Hosanna Annexation, approximately 5.722 acres, located at 743 24 ¾ Road, and introduce an ordinance annexing territory to the City of Grand Junction, Colorado, Hosanna Annexation, approximately 5.722 acres, located at 743 24 3/4 Road and Set a Hearing for April 3, 2019.

HOSANNA ANNEXATION

LYING IN THE NW 1/4 SE 1/4 OF SECTION 33 , TOWNSHIP 1 NORTH, RANGE 1 WEST
UTE PRINCIPAL MERIDIAN
COUNTY OF MESA, STATE OF COLORADO

DESCRIPTION

A certain parcel of land lying in the Northwest Quarter of the Southeast Quarter (NW 1/4 SE 1/4) of Section 33, Township 1 South, Range 1 West of the Ute Principal Meridian, County of Mesa, State of Colorado and being more particularly described as follows:

COMMENCING at the Northwest corner of the Southeast Quarter (SE 1/4) of said Section 33 and assuming the North line of the NW 1/4 SE 1/4 of said Section 33 bears S 89°53'19" E with all other bearings contained herein being relative thereto; thence from said Point of Commencement, S 89°53'19" E, along the North line of the NW 1/4 SE 1/4 of said Section 33 a distance of 658.53 feet to the POINT OF BEGINNING; thence from said Point of Beginning, continue N 89°53'19" E, along said North line, a distance of 270.28 feet; thence S 00°06'41" W, a distance of 25.00 feet to a point on the centerline of the existing Grand Valley Canal; thence Southeasterly along the centerline of the Grand Valley Canal the following four (4) courses:

1. S 43°37'30" E, a distance of 36.75 feet,
2. S 41°37'54" E, a distance of 88.95 feet,
3. S 40°40'11" E, a distance of 192.33 feet,
4. S 43°12'52" E, a distance of 27.89 feet, more or less, to a point on the East line of Lot 1, Collins-Baumgartner Subdivision, as same is recorded in Book 4329, Page 69, Public Records of Mesa County, Colorado projected Northerly; thence,

S 00°07'13" E, along the East line of said Lot 1, a distance of 143.93 feet, more or less, to a point being the Northeast corner of Lot 2 of said Collins-Baumgartner Subdivision; thence N 89°54'18" W, along the North line of said Lot 2, a distance of 182.21 feet, more or less, to a point being the Northwest corner of said Lot 2; thence S 04°41'51" W, along the West line of said Lot 2, a distance of 231.92 feet, more or less, to a point on the North line of North Valley Subdivision Filing No. Four, as same is recorded in Plat Book 16, Pages 188 and 189, Public Records of Mesa County, Colorado; thence N 89°54'18" W, along the North line of said North Valley Subdivision Filing No. Four and the South line of said Lot 1, Collins-Baumgartner Subdivision, a distance of 297.24 feet, more or less, to a point being the Southwest corner of said Lot 1; thence N 00°05'09" W, along the West line, and Northerly projection of said Lot 1, a distance of 659.09 feet, more or less, to the Point of Beginning.

NOTE

The Collins-Baumgartner Subvision, as recorded in Book 4329, Page 69, Public Records of Mesa County, Colorado, incorrectly depicted the ownership of the lands to an "apparent Southwesterly right of way line for the Grand Valley Canal". The ownership should have been depicted extending to the centerline of said Grand Valley Canal.

NOTICE OF HEARING
ON PROPOSED ANNEXATION OF LANDS
TO THE CITY OF GRAND JUNCTION, COLORADO

NOTICE IS HEREBY GIVEN that at a regular meeting of the City Council of the City of Grand Junction, Colorado, held on the 20th day of February 2019, the following Resolution was adopted:

CITY OF GRAND JUNCTION, COLORADO

RESOLUTION NO. ____

A RESOLUTION
REFERRING A PETITION TO THE CITY COUNCIL
FOR THE ANNEXATION OF LANDS
TO THE CITY OF GRAND JUNCTION, COLORADO,
SETTING A HEARING ON SUCH ANNEXATION,
AND EXERCISING LAND USE CONTROL

HOSANNA ANNEXATION

APPROXIMATELY 5.722 ACRES LOCATED AT 743 24 ¾ ROAD

WHEREAS, on the 20th day of February 2019, a petition was referred to the City Council of the City of Grand Junction, Colorado, for annexation to said City of the following property situate in Mesa County, Colorado, and described as follows:

HOSANNA ANNEXATION

A certain parcel of land lying in the Northwest Quarter of the Southeast Quarter (NW 1/4 SE 1/4) of Section 33, Township 1 South, Range 1 West of the Ute Principal Meridian, County of Mesa, State of Colorado and being more particularly described as follows:

COMMENCING at the Northwest corner of the Southeast Quarter (SE 1/4) of said Section 33 and assuming the North line of the NW 1/4 SE 1/4 of said Section 33 bears S 89º53'19" E with all other bearings contained herein being relative thereto; thence from said Point of Commencement, S 89º53'19" E, along the North line of the NW 1/4 SE 1/4 of said Section 33 a distance of 658.53 feet to the POINT OF BEGINNING; thence from said Point of Beginning, continue N 89º53'19" E, along said North line, a distance of 270.28 feet; thence S 00º06'41" W, a distance of 25.00 feet to a point on the centerline of the existing Grand Valley Canal; thence Southeasterly along the centerline of the Grand Valley Canal the following four (4) courses:

1. S 43º37'30" E, a distance of 36.75 feet,
2. S 41º37'54" E, a distance of 88.95 feet,
3. S 40º40'11" E, a distance of 192.33 feet,
4. S 43º12'52" E, a distance of 27.89 feet, more or less, to a point on the East line of Lot 1, Collins-Baumgartner Subdivision, as same is recorded in Book 4329, Page 69, Public Records of Mesa County, Colorado projected Northerly; thence…

S 00º07'13" E, along the East line of said Lot 1, a distance of 143.93 feet, more or less, to a point being the Northeast corner of Lot 2 of said Collins-Baumgartner Subdivision; thence N 89º54'18 W, along the North line of said Lot 2, a distance of 182.21 feet, more or less, to a point being the Northwest corner of said Lot 2; thence S 04º41'51" W, along the West line of said Lot 2, a distance of 231.92 feet, more or less, to a point on the North line of North Valley Subdivision Filing No. Four, as same is recorded in Plat Book

16, Pages 188 and 189, Public Records of Mesa County, Colorado; thence N 89º54'18" W, along the North line of said North Valley Subdivision Filing No. Four and the South line of said Lot 1, Collins-Baumgartner Subdivision, a distance of 297.24 feet, more or less, to a point being the Southwest corner of said Lot 1; thence N 00º05'05" W, along the West line, and Northerly projection of said Lot 1, a distance of 659.09 feet, more or less, to the Point of Beginning.

CONTAINING 249,266 Square Feet or 5.722 Acres, more or less, as described.

WHEREAS, the Council has found and determined that the petition complies substantially with the provisions of the Municipal Annexation Act and a hearing should be held to determine whether or not the lands should be annexed to the City by Ordinance;

NOW, THEREFORE, BE IT RESOLVED BY THE CITY COUNCIL OF THE CITY OF GRAND JUNCTION:

1. That a hearing will be held on the 3rd day of April, 2019, in the City Hall auditorium, located at 250 North 5th Street, City of Grand Junction, Colorado, at 6:00 PM to determine whether one-sixth of the perimeter of the area proposed to be annexed is contiguous with the City; whether a community of interest exists between the territory and the city; whether the territory proposed to be annexed is urban or will be urbanized in the near future; whether the territory is integrated or is capable of being integrated with said City; whether any land in single ownership has been divided by the proposed annexation without the consent of the landowner; whether any land held in identical ownership comprising more than twenty acres which, together with the buildings and improvements thereon, has an assessed valuation in excess of two hundred thousand dollars is included without the landowner's consent; whether any of the land is now subject to other annexation proceedings; and whether an election is required under the Municipal Annexation Act of 1965.

2. Pursuant to the State's Annexation Act, the City Council determines that the City may now, and hereby does, exercise jurisdiction over land use issues in the said territory. Requests for building permits, subdivision approvals and zoning approvals shall, as of this date, be submitted to the Community Development Department of the City.

ADOPTED the _____ day of _____, 2019.

Submitted By: Kristen Ashbeck, Senior Planner

Information

SUBJECT:

Introduction of an Ordinance Amending Ordinance No. 4508 for the Planned Residential Development - North 7th Street to Disallow the Use of Vinyl Fencing on Properties Within the District and Set a Public Hearing for March 20, 2019

RECOMMENDATION:

The Historic Preservation Board recommended approval of the amendment at its December 4, 2018 meeting. The Planning Commission heard this item at its February 12, 2019 meeting and unanimously recommended approval.

EXECUTIVE SUMMARY:

Initiated by the Historic Preservation Board in conjunction with input from property owners within the North Seventh Street Historic Residential District, this request is to amend Planned Development Ordinance 4508 which established the Guidelines and Standards for the North Seventh Street District. The proposed amendment will clarify language in the Guidelines and Standards, expressly disallowing the use of vinyl fencing on properties within the District.

BACKGROUND OR DETAILED INFORMATION:

By adoption of Ordinance 4508 in March 2012, the North Seventh Street Historic Residential District Guidelines and Standards became effective. The Guidelines and Standards dictate that the Historic Preservation Board shall hear and decide applications for alteration/construction on properties within the District.

In mid-2018, the Board heard a proposal from a property owner to replace an existing

6-foot privacy wooden fence with a 6-foot vinyl privacy fence in areas of the yard that are visible from North 7th Street. This proposal brought to light the fencing section of the Guidelines and Standards that is somewhat vague as to the allowance of vinyl fencing within the District. There is no outright prohibition regarding vinyl fencing but a statement in the guidelines (not standards) that vinyl is "not an appropriate fencing material."

The Guidelines and Standards currently state:

26.20.090 Fencing.
(a) ***Guideline****. Fencing materials and styles should complement the character of the District. Fence styles, particularly in front yards, should be similar to those from the restoration era of the buildings on site. Modern or artificial materials, such as plastic and vinyl, are not appropriate fencing materials. In addition to the regulations for fences applicable to the R-8 zone, fences in the District shall adhere to the requirements of this section.*

The Historic Preservation Board approved the application for vinyl fencing in a side yard, but discussed the desire to have further clarity in the regulations regarding vinyl fencing as many board members felt that vinyl fencing should not be permitted. In late 2018, the Historic Preservation Board sought input from property owners within the District as to whether vinyl should be strictly disallowed or whether it is an appropriate material acceptable to property owners. The survey letter and the results of the poll are included in the attachments. In summary, 65 percent of the surveys were returned. Of those, 50 percent preferred the option of not allowing the use of vinyl fencing in the District at all, and 23 percent preferred the option of only allowing vinyl fencing in portions of the yard that could not be seen from 7th Street or any of the side streets. The Board interpreted these results as the majority of property owners preferred that vinyl fencing not be allowed within the District. As such, the Historic Preservation Board recommended the following revision to the Guidelines and Standards as follows:

26.20.090 Fencing. – Delete the sentence with strikethrough below
(a) Guideline. *Fencing materials and styles should complement the character of the District. Fence styles, particularly in front yards, should be similar to those from the restoration era of the buildings on site. ~~Modern or artificial materials, such as plastic and vinyl, are not appropriate fencing materials.~~ In addition to the regulations for fences applicable to the R-8 zone, fences in the District shall adhere to the requirements of this section.*

Add the standard listed below:

(b) Standard. *Vinyl or plastic fencing is not appropriate on any part of a property*

within the North Seventh Street Historic Residential District and use of such fencing is not allowed.

NOTIFICATION REQUIREMENTS

The property owners within the North Seventh Street Historic Residential District were notified of the proposed changed via letters that summarized the results of their input as well as the proposed language. The letter was sent to property owners twice – once in December 2018 and again in January 2019. The second letter included the proposed dates, times and locations of the public hearings for both Planning Commission and City Council.

ANALYSIS

In accordance with Section 21.02.150(e), a proposed amendment to an approved Final Development Plan for a PD zone district shall address the same process and criteria used for outline development plan review and approval as listed below. However, many of these criteria are not relevant to a change such as that proposed for the North Seventh Street Historic Residential District Guidelines and Standards regarding the use of vinyl fencing on properties within the District. The change is generally inconsequential to adopted plans and policies since it is only applicable to the properties within the District. The change will improve the aesthetics of the historic character of the neighborhood.

(i) The Comprehensive Plan, Grand Junction Circulation Plan and other adopted plans and policies;

The proposed amendment will reinforce Goal 6 of the Comprehensive Plan which states: Land use decisions will encourage preservation of existing buildings and their appropriate reuse. Staff finds this criterion has been met.

(ii) The rezoning criteria provided in GJMC 21.02.140(a) as stated below;

(1) Subsequent events have invalidated the original premises and findings; and/or
(2) The character and/or condition of the area has changed such that the amendment is consistent with the Plan; and/or
(3) Public and community facilities are adequate to serve the type and scope of land use proposed; and/or
(4) An inadequate supply of suitably designated land is available in the community, as defined by the presiding body, to accommodate the proposed land use; and/or
(5) The community or area, as defined by the presiding body, will derive benefits from the proposed amendment.

The proposed amendment to the PD zone district is not relevant to the rezone criteria with the exception of (3) and (5) above. The existing neighborhood is certainly served

by adequate public and community facilities that will not be impacted by the proposed change. The neighborhood and the community in general will derive benefit from the amendment as it will reinforce and enhance the character of the historic district. Staff finds this criterion has been met.

(iii) The planned development requirements of Chapter 21.05 GJMC listed below;

21.05.020 Default standards.
The use, bulk, development, improvement and other standards for each planned development shall be derived from the underlying zoning, as defined in Chapter 21.03 GJMC.

21.05.030 Establishment of uses.
(a) Uses Allowed. At the time of zoning a parcel to PD, the City Council shall determine the allowed uses. Only uses consistent in type and density with the Comprehensive Plan may be allowed within a PD. The type and density of allowed uses should generally be limited to uses allowed in the default zoning.
(b) Adoption and Modification of Authorized Uses. The City Council, at the time of establishing a PD zone, shall list uses that are authorized by right or by conditional use permit. All uses, whether by right or conditional use permit, shall be subject to all applicable permit and approval processes established in this code.

21.05.040 Development standards.
(a) Generally. Planned development shall minimally comply with the development standards of the default zone and all other applicable code provisions, except when the City Council specifically finds that a standard or standards should not be applied. Planned development shall comply with GJMC 21.02.150.

(b) Residential Density. Dwelling unit densities in planned development shall comply with the maximum and minimum densities of the Comprehensive Plan or default zone.

(c) Nonresidential Intensity. A maximum floor area shall be established at the time of planned development approval. In determining the maximum floor area, the Planning Commission and City Council shall consider:

(1) The intensity of adjacent development;
(2) The demand for and/or mix of residential and nonresidential development in the proposed PD and in the vicinity of the proposed PD;
(3) The availability of transportation facilities, including streets, parking, transit facilities and bicycle/pedestrian facilities;
(4) The adequacy of utilities and public services.

(d) Mixed Use Intensity.

(1) In mixed use developments in areas designated for residential development in the Comprehensive Plan, no more than 10 percent of the land area may be dedicated to nonresidential uses.
(2) The maximum residential densities within mixed use developments designated for nonresidential development in the Comprehensive Plan shall not exceed 24 dwelling units per acre. In such developments, residential uses shall not constitute more than 75 percent of total floor area.

(e) Minimum District Size. A minimum of five acres is recommended for a planned development unless the Planning Commission recommends and the City Council finds that a smaller site is appropriate for the development or redevelopment as a PD.

(f) Development Standards. Planned development shall meet the development standards of the default zone or the following, whichever is more restrictive. Exceptions may be allowed only in accordance with this section.

(1) Setback Standards. Principal structure setbacks shall not be less than the minimum setbacks for the default zone unless the applicant can demonstrate that:

(i) Buildings can be safely designed and that the design is compatible with lesser setbacks. Compatibility shall be evaluated under the International Fire Code and any other applicable life, health or safety codes;
(ii) Reduced setbacks are offset by increased screening or primary recreation facilities in private or common open space;
(iii) Reduction of setbacks is required for protection of steep hillsides, wetlands or other environmentally sensitive natural features.

(2) Open Space. All residential planned developments shall comply with the minimum open space standards established in the open space requirements of the default zone.

(3) Fencing/Screening. Fencing shall comply with GJMC 21.04.040(i).

(4) Landscaping. Landscaping shall meet or exceed the requirements of GJMC 21.06.040.

(5) Parking. Off-street parking shall be provided in accordance with GJMC 21.06.050.

(6) Street Development Standards. Streets, alleys and easements shall be designed and constructed in accordance with TEDS (GJMC Title 29) and applicable portions of GJMC 21.06.060.

(g) Deviation from Development Default Standards. The Planning Commission may

recommend that the City Council deviate from the default district standards subject to the provision of any of the community amenities listed below.

(1) Transportation amenities including, but not limited to, trails other than required by the multimodal plan, bike or pedestrian amenities or transit oriented improvements, including school and transit bus shelters;
(2) Open space, agricultural land reservation or land dedication of 20 percent or greater;
(3) Community facilities for provision of public services beyond those required for development within the PD;
(4) The provision of affordable housing for moderate, low and very low income households pursuant to HUD definitions for no less than 20 years; and
(5) Other amenities, in excess of minimum standards required by this code, that the Council specifically finds provide sufficient community benefit to offset the proposed deviation.

The proposed amendment does not impact the Planned Development (PD) zone district and plan as it was originally established via Ordinance 4508 except for the clarification of the use of vinyl fencing on properties within the district. The existing Guidelines and Standards that form the PD Plan already include some deviations from the underlying zone district of R-8. This revision to the standards is another deviation from what would typically be allowed by the Code but it is intended to be more restrictive in order to clarify the standards and contribute to the preservation of the character of the historic district. Staff finds this criterion has been met.

(iv) The applicable corridor guidelines and other overlay districts in GJMC Titles 23, 24 and 25;

There are no other corridor or other overlay districts that apply to the North Seventh Street Historic Residential District thus, this criterion does not apply to this proposed change.

(v) Adequate public services and facilities shall be provided concurrent with the projected impacts of the development;

The proposed amendment is not relevant to this criterion.

(vi) Adequate circulation and access shall be provided to serve all development pods/areas to be developed;

The proposed amendment is not relevant to this criterion.

(vii) Appropriate screening and buffering of adjacent property and uses shall be

provided;

The proposed amendment is not relevant to this criterion.

(viii) An appropriate range of density for the entire property or for each development pod/area to be developed;

The proposed amendment is not relevant to this criterion.

(ix) An appropriate set of "default" or minimum standards for the entire property or for each development pod/area to be developed; and

The proposed amendment is not relevant to this criterion.

(x) An appropriate phasing or development schedule for the entire property or for each development pod/area to be developed.

The proposed amendment is not relevant to this criterion.

STAFF RECOMMENDATION AND FINDINGS OF FACT

Staff finds that the proposed amendment to the Planned Development zone district for the North Seventh Street Historic Residential District is an appropriate revision to clarify the Standards and Guidelines regarding the use of vinyl fencing on properties in the District and thus, meets the criteria of Section 21.02.150(e) of the Zoning and Development Code.

SUGGESTED MOTION:

I move to introduce an ordinance amending Ordinance No. 4508 for the Planned Residential Development - North 7th Street consisting of Guidelines and standards by which new construction or alterations within the Zone are determined to disallow the use of vinyl fencing on properties within the District and set a hearing for March 20, 2019.

CITY OF Grand Junction COLORADO

COMMUNITY DEVELOPMENT

September 17, 2018

Dear North Seventh Street Historic District Property Owners:

As you are aware, the Grand Junction Historic Preservation Board reviews and approves Certificate of Appropriateness applications within the North Seventh Street Historic Residential District according to the adopted Guidelines and Standards for the District.

Recent reviews by the Board of fencing proposals have brought to light the fencing section of the Guidelines and Standards that is somewhat vague as to the allowance of vinyl fencing within the District. There is no clear direction as to whether vinyl is allowed or disallowed, just a statement that vinyl is not an appropriate fencing material. The Guidelines and Standards currently state:

26.20.090 Fencing.

(a) ***Guideline.*** *Fencing materials and styles should complement the character of the District. Fence styles, particularly in front yards, should be similar to those from the restoration era of the buildings on site. Modern or artificial materials, such as plastic and vinyl, are not appropriate fencing materials. In addition to the regulations for fences applicable to the R-8 zone, fences in the District shall adhere to the requirements of this section.*

The Historic Preservation Board is seeking input from property owners as to whether vinyl should be strictly disallowed or whether it is an appropriate material acceptable to property owners. Please take a moment to review the poll on the back of this letter, provide your input and return this letter in the self-addressed stamped envelope provided by October 12, 2018.

Thank you for your time and attention to this matter.

Sincerely,

Chris Endreson, Chair

Grand Junction Historic Preservation Board

FIRST NOTICE

Dear North Seventh Street Historic District Property Owners:

The Historic Preservation Board appreciates the timely and informative feedback received on its last correspondence to you regarding the use of vinyl fencing within the North Seventh Street Historic Residential District. A good majority of you (65%) responded to the survey. Of the responses received, 50% favored revising the Guidelines and Standards such that vinyl fencing would be expressly disallowed in the District. Another 23% of respondents favored use of vinyl fencing only in areas of the yard that cannot be viewed from adjacent streets. The Board felt that, since the yard area not seen from the street is a very limited area on most properties in the District, this response effectively suggests not allowing use of vinyl in the District.

Therefore, unless there is further opposition, the Board will recommend to the City Planning Commission and City Council an amendment to Section 26.20.090 of the Guidelines and Standards that will expressly disallow the use of vinyl fencing in the District. The proposed language will be as stated below.

26.20.090 Fencing. – Delete the sentence with strikethrough below

(a) ***Guideline.*** *Fencing materials and styles should complement the character of the District. Fence styles, particularly in front yards, should be similar to those from the restoration era of the buildings on site. ~~Modern or artificial materials, such as plastic and vinyl, are not appropriate fencing materials.~~ In addition to the regulations for fences applicable to the R-8 zone, fences in the District shall adhere to the requirements of this section.*

Add the standard listed below

(b) ***Standard.*** *Vinyl or plastic fencing is not appropriate on any part of a property within the North Seventh Street Historic Residential District and use of such fencing is not allowed.*

Please contact City staff to the Historic Preservation Board, Kristen Ashbeck at 970-244-1491 or kristena@gjcity.org if you have questions or concerns with this proposal. Otherwise, the Board intends to move forward on this revision to the Guidelines and Standards in the near future. As property owners within the North Seventh Street

Historic Residential District, you will be notified of the public hearings on the item and are welcome to attend those meetings.

CITY OF Grand Junction COLORADO

FINAL NOTICE

Dear North Seventh Street Historic District Property Owners:

In the event the December first mailing of this letter was not received during the holidays, the Historic Preservation Board is providing this information to you again. The Board appreciates the timely and informative feedback received on its last correspondence to you regarding the use of vinyl fencing within the North Seventh Street Historic Residential District. A good majority of you (65%) responded to the survey. Of the responses received, 50% favored revising the Guidelines and Standards such that vinyl fencing would be expressly disallowed in the District. Another 23% of respondents favored use of vinyl fencing only in areas of the yard that cannot be viewed from adjacent streets. The Board felt that, since the yard area not seen from the street is a very limited area on most properties in the District, this response effectively suggests not allowing use of vinyl in the District.

Therefore, unless there is further opposition, the Board will recommend to the City Planning Commission and City Council an amendment to Section 26.20.090 of the Guidelines and Standards that will expressly disallow the use of vinyl fencing in the District. The proposed language will be as stated below.

26.20.090 Fencing. – Delete the sentence with strikethrough below

(a) ***Guideline.*** *Fencing materials and styles should complement the character of the District. Fence styles, particularly in front yards, should be similar to those from the restoration era of the buildings on site. ~~Modern or artificial materials, such as plastic and vinyl, are not appropriate fencing materials.~~ In addition to the regulations for fences applicable to the R-8 zone, fences in the District shall adhere to the requirements of this section.*

Add the standard listed below

(b) ***Standard.*** *Vinyl or plastic fencing is not appropriate on any part of a property within the North Seventh Street Historic Residential District and use of such fencing is not allowed.*

Please contact City staff to the Historic Preservation Board, Kristen Ashbeck at 970-244-1491 or kristena@gjcity.org if you have questions or concerns with this proposal. Otherwise, the Board intends to move forward on this revision to the Guidelines and Standards at the following upcoming meetings:

City Planning Commission – February 12, 2019
City Council Public Hearing – March 6, 2019

Thank you again for your responses and time and attention to this matter.

Sincerely,

Grand Junction Historic Preservation Board

CITY OF GRAND JUNCTION, COLORADO

ORDINANCE NO. _____

AN ORDINANCE AMENDING ORDINANCE No. 4508 FOR THE PLANNED RESIDENTIAL DEVELOPMENT – NORTH 7TH STREET CONSISTING OF GUIDELINES AND STANDARDS BY WHICH NEW CONSTRUCTION OR ALTERATIONS WITHIN THE ZONE ARE DETERMINED TO DISALLOW THE USE OF VINYL FENCING ON PROPERTIES WITHIN THE DISTRICT

Recitals:

In March 2012, the City Council of the City of Grand Junction found that it was in the interest of the public to adopt the *North Seventh Street Historic Residential District Guidelines and Standards* as the new Plan for the *Planned Residential Development-North 7th Street* zone district.

Furthermore, the City Council has determined that the Plan achieves long-term community benefits by establishing a process and guidelines and standards for review of development in a unique, nationally recognized historic neighborhood in the City.

The bulk, development, improvement, architectural and design standards are derived from the *North Seventh Street Historic Residential District Guidelines and Standards.* The City Council finds that the proposed amendment regarding the use of vinyl fencing on properties within the District clarifies this concern and will contribute to maintaining the overall historic character of the North Seventh Street Historic Residential District.

After public notice and public hearing as required by the Grand Junction Zoning and Development Code, the Grand Junction Planning Commission recommended approval of the proposed amendment to the North Seventh Street Historic Residential District Guidelines and Standards.

NOW THEREFORE BE IT ORDAINED BY THE CITY COUNCIL OF THE CITY OF GRAND JUNCTION THAT:

The North Seventh Street Historic Residential Guidelines and Standards are amended as follows (additions underlined, deletions struck through):

26.20.090 Fencing.

(a) ***Guideline.*** *Fencing materials and styles should complement the character of the District. Fence styles, particularly in front yards, should be similar to those from the restoration era of the buildings on site.* ~~*Modern or artificial materials, such as plastic and vinyl, are not appropriate fencing materials.*~~ *In addition to the regulations for fences applicable to the R-8 zone, fences in the District shall adhere to the requirements of this section.*

(b) ***Standard.*** *Vinyl or plastic fencing is not appropriate on any part of a property within the North Seventh Street Historic Residential District and use of such fencing is not allowed.*

Introduced on first reading this 20th day of February 2019 and ordered published in pamphlet form.

Adopted on second reading this _____ day of _____, 2019 and ordered published in pamphlet form.

Item #2.a.iii.

Meeting Date: February 20, 2019

Presented By: Scott D. Peterson, Senior Planner

Department: Community Development

Submitted By: Scott D. Peterson, Senior Planner

Information

SUBJECT:

Introduction of an Ordinance Zoning the South Twenty Annexation R-4 (Residential - 4 du/ac) and R-8 (Residential - 8 du/ac), Located at 2335 H Road and Set a Public Hearing for March 6, 2019

RECOMMENDATION:

The Planning Commission heard this item at their February 12, 2019 meeting and recommended approval (5 to 0).

EXECUTIVE SUMMARY:

The Applicant, South Twenty LLC, is requesting a split zone of annexation to R-4 (Residential – 4 du/ac) and R-8 (Residential – 8 du/ac) for the South Twenty Annexation. The approximately 20.18-acre parcel is located on the south side of H Road and has split Comprehensive Plan Future Land Use Map designations of Residential Medium (4 – 8 du/ac) and Residential High Mixed Use (16 – 24 du/ac). The property is currently vacant.

The proposed split zoning designations of R-4 and R-8 meets with the intent of achieving the desired overall density for the property as a compromise between the two land use categories. Section 21.02.130 (d) of the Zoning and Development Code allows for the consideration of zoning without a plan amendment when the property is adjacent to the land use designation that would support the requested zone district. In this case, the applicant is proposing zone districts at the low and high end of the Residential Medium land use designation. The Applicant is requesting annexation into the City limits per the Persigo Agreement between Mesa County and the City of Grand Junction in order to develop a residential subdivision in the near future, in conformance

with the requested R-4 and R-8 zone districts. The request for annexation will be considered separately by the City Council.

BACKGROUND OR DETAILED INFORMATION:

The Applicant, South Twenty LLC, has requested annexation of land into the City limits, located at 2335 H Road, in anticipation of future residential development. The property is approximately 20.18-acres in size, which includes 0.441-acres of the adjacent H Road right-of-way. The Applicant is requesting a zone of annexation to R-4 (Residential – 4 du/ac) and R-8 (Residential – 8 du/ac).

The property is currently in the County and retains a County zoning of RSF-R (Residential Single Family - Rural) and surrounding properties are also zoned RSF-R in the County, ranging in size from 4.66 acres to 26.9 acres. The subject property has split Future Land Use designations of Residential Medium (4 – 8 du/ac) and Residential High Mixed Use (16 – 24 du/ac). The Applicant's proposed split zoning designations of R-4 and R-8 meets with the intent of achieving the desired overall density for the property as a compromise between these two land use categories in order for a portion of the property to be developed at the high end of the Residential Medium category.

As reference, the existing Future Land Use Map categories that divide the property are not legal descriptions, but rather serve as guidance in determining the proper zone district. When a Future Land Use designation splits a property, either or both land use categories can be used to determine the appropriate zoning district. Section 21.02.130(d) (v) of the Zoning and Development Code allows for consideration of zoning without a Plan amendment when the property is adjacent to the land use designation that would support the requested zone district.

The surrounding area is largely undeveloped, rural in nature and zoned RSF-R in Mesa County. Properties that have been annexed into the City include Apple Glen Subdivision (2366 H Road) which is zoned R-4 (Residential – 4 du/ac) and the Mosaic property located at the intersection of H Road and 23 Road which is zoned Planned Development with an overall average residential density between 7 to 9 dwelling units an acre.

The Applicant is requesting the R-4 zone district for the south 14.3 acres and the R-8 zone district for the north 5.46 acres adjacent to H Road. See attached map exhibits for additional information.

NOTIFICATION REQUIREMENTS

Neighborhood Meeting:

A Neighborhood Meeting regarding the proposed Annexation and Zoning was held on June 28, 2018 in accordance with Section 21.02.080 (e) of the Zoning and

Development Code. The Applicant's and City staff were in attendance along with nine (9) citizens. Comments and concerns expressed by the attendees centered on the proposed higher density and the desire to see larger acreage lots of at least a-half acre or more. Concerns were also expressed about the increase in traffic in the area. The application for annexation and zoning was submitted on October 11, 2018.

Notice was completed consistent with the provisions in Section 21.02.080 (g) of the City's Zoning and Development Code. The subject property was posted with an application sign on October 29, 2018. Mailed notice of the public hearings before Planning Commission and City Council in the form of notification cards was sent to surrounding property owners within 500 feet of the subject property on January 11, 2019 & February 1,2019.

ANALYSIS

The criteria for review is set forth in Section 21.02.140 (a) and includes that the City may rezone property if the proposed changes are consistent with the vision, goals and policies of the Comprehensive Plan and must meet one or more of the following rezone criteria as identified:

(1) Subsequent events have invalidated the original premises and findings; and/or

The property owners have petitioned for annexation into the City limits with a requested zoning district of R-4 and R-8 which is compatible with the existing Comprehensive Plan Future Land Use Map designation of Residential Medium (4 – 8 du/ac), in accordance with Section 21.02.130 (d) (1) (iii) & (v) of the Zoning & Development Code. Since the property is currently in the County, the annexation of the property is a subsequent event that has invalidated the original premise. The requested annexation and zoning is also in accordance with the Persigo Agreement between Mesa County and the City of Grand Junction, which states that all new development shall be annexed into the City limits. Therefore, Staff has found this criterion has been met.

(2) The character and/or condition of the area has changed such that the amendment is consistent with the Plan; and/or

The adoption of the Comprehensive Plan in 2010, designated this property as split Future Land Use designations of Residential Medium (4 – 8 du/ac) and Residential High Mixed Use (16 – 24 du/ac). The character and/or condition of the area has not changed in recent years as the adjacent residential properties are currently large acreage and have not yet fully developed with the exception of the new Apple Glen development. Nearby, the Mosaic development has received project entitlements but has not yet begun construction. The subject property is underutilized in terms of the residential development potential anticipated by the Comprehensive Plan designation

of Residential Medium (4 -8 du/ac) that would allow for densities up to 8 units per acre. The Applicant is requesting a split zone of R-4 and R-8 which furthers the goals and policies of the Comprehensive Plan by providing for density in the mid-range of the Residential Medium (4 – 8 du/ac) land use classification. Because there has been no apparent change of character and/or condition and the area has not significantly changed, Staff finds that this criterion has not been met.

(3) Public and community facilities are adequate to serve the type and scope of land use proposed; and/or

Adequate public and community facilities and services are available to the property and are sufficient to serve land uses associated with the R-4 and R-8 zone districts. Ute Water is presently available within the H Road right-of-way and the applicant has represented they have an easement across adjacent properties to the south to connect into City sanitary sewer that is available in the I-70 Frontage Road. Property can also be served by Xcel Energy natural gas and both Xcel Energy and Grand Valley Power electric. A short distance away is Appleton Elementary School and further to the southeast along 24 Road is Canyon View Park. Further to the south along Patterson Road are commercial retail centers that includes Mesa Mall, offices, convenience stores and gas islands, restaurants, commercial businesses and a grocery store. Community Hospital is also nearby on G Road.

Grand Junction Fire Department finds the public and community facilities regarding fire and emergency medical services are adequate to serve the type and scope of the residential land use proposed. Primary response is from Fire Station 3 located at 582 25 ½ Road and response time are longer than other areas due to the distance from existing fire stations. Evaluating the last two years of fire and EMS incident data, shows an average response time to this area of H Road as being 12 minutes and 33 seconds, which is significantly longer than National Fire Protection Association response time standards. This response time is also approximately 8 minutes and 5 seconds longer than for the core area of the City. However, the City has been working to address the current and future fire and EMS coverage demands of this area and is planning for a new Fire Station immediately adjacent to this property on the west side of 23 and H Road with the Mosaic development.

The public and community facilities are adequate to serve the type and scope of the residential land use proposed, therefore, staff finds this criterion has been met.

(4) An inadequate supply of suitably designated land is available in the community, as defined by the presiding body, to accommodate the proposed land use; and/or

The property and surrounding area has split Comprehensive Plan Future Land Use Map designations of Residential Medium (4 – 8 du/ac) and Residential High Mixed Use

(16 – 24 du/ac). The property is currently vacant. The proposed split zoning designations of R-4 and R-8 meets with the intent of achieving the desired overall density for the property as a compromise between the two categories in order for a portion of the property to be developed at the high end of the Residential Medium category. This area of the community currently has no R-8 zoning. The lack of supply for this zone type impedes the ability to provide a diverse supply of housing types; a key principle in the Comprehensive Plan. Staff finds that there is an inadequate supply of the requested zoning designations in the area and, therefore, has found this criterion to have been met.

(5) The community or area, as defined by the presiding body, will derive benefits from the proposed amendment.

The community and area will benefit from this proposed request. Annexation and zoning of the property will create consistent land use jurisdiction within the City consistent with an Intergovernmental Agreement with the County. The requested zones will also provide an opportunity for a variety of housing within a range of densities that are consistent with the Comprehensive plan in this area to meet the needs of the growing community. This principle is supported and encouraged by the Comprehensive Plan and furthers the plan's goal of promoting a diverse supply of housing types; a key principle in the Comprehensive Plan. Therefore, Staff finds that this criterion has been met.

Section 21.02.160 (f) of the Grand Junction Zoning and Development Code provides that the zoning of an annexation area shall be consistent with the adopted Comprehensive Plan and the criteria set forth. Generally, future development should be at a density equal to or greater than the allowed density of the applicable County zoning district. Though other zone districts could also be considered, these zone districts comport with the recommendations of the Plan's Future Land Use Map.

Further, the zoning request is consistent with the following goals and policies of the Comprehensive Plan:

Goal 1 / Policy A: Land use decisions will be consistent with Future Land Use Map.

Goal 3: The Comprehensive Plan will create ordered and balanced growth and spread future growth throughout the community.

Goal 5: To Provide a broader mix of housing types in the community to meet the needs of a variety of incomes, family types and life stages.

FISCAL IMPACT:

The provision of municipal services will be consistent with adjacent properties already

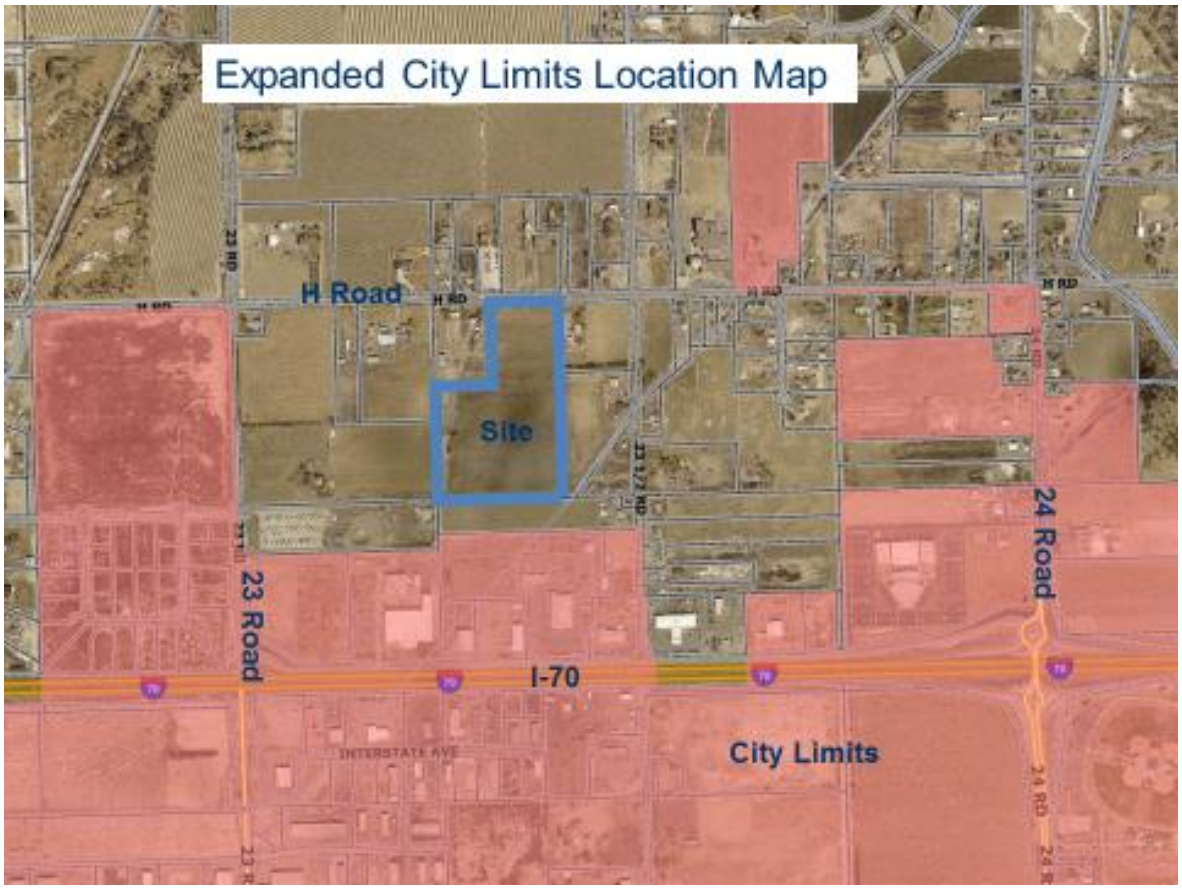
in the City. Property tax levies and municipal sales/use tax will be collected, as applicable, upon annexation. Based on the current assessed values of the annexation area, the City property tax revenue is estimated to be $55.76 annually. If the property develops at an estimated 96 units for $250,000 each, the estimated annual property tax revenue (at the current residential assessment rate) would be $13,824 per year. Sales and use tax revenues will be dependent on construction activity and consumer spending on City taxable items for residential and commercial uses.

Currently the property is in the Grand Junction Rural Fire Protection District (Rural District) which is served by the Grand Junction Fire Department through a contract with the Rural District. The Rural District collects a 5.938 mill levy that generates $41.39 per year in property taxes that are passed on to the City of Grand Junction per the contract. If annexed, the Rural District mill levy will be removed and the City's 8 mills that will generate $55.76 per year will need to pay for not only fire and emergency medical services but also other City services provided to the area. City services as discussed below are supported by a combination of property taxes and sales/use taxes.

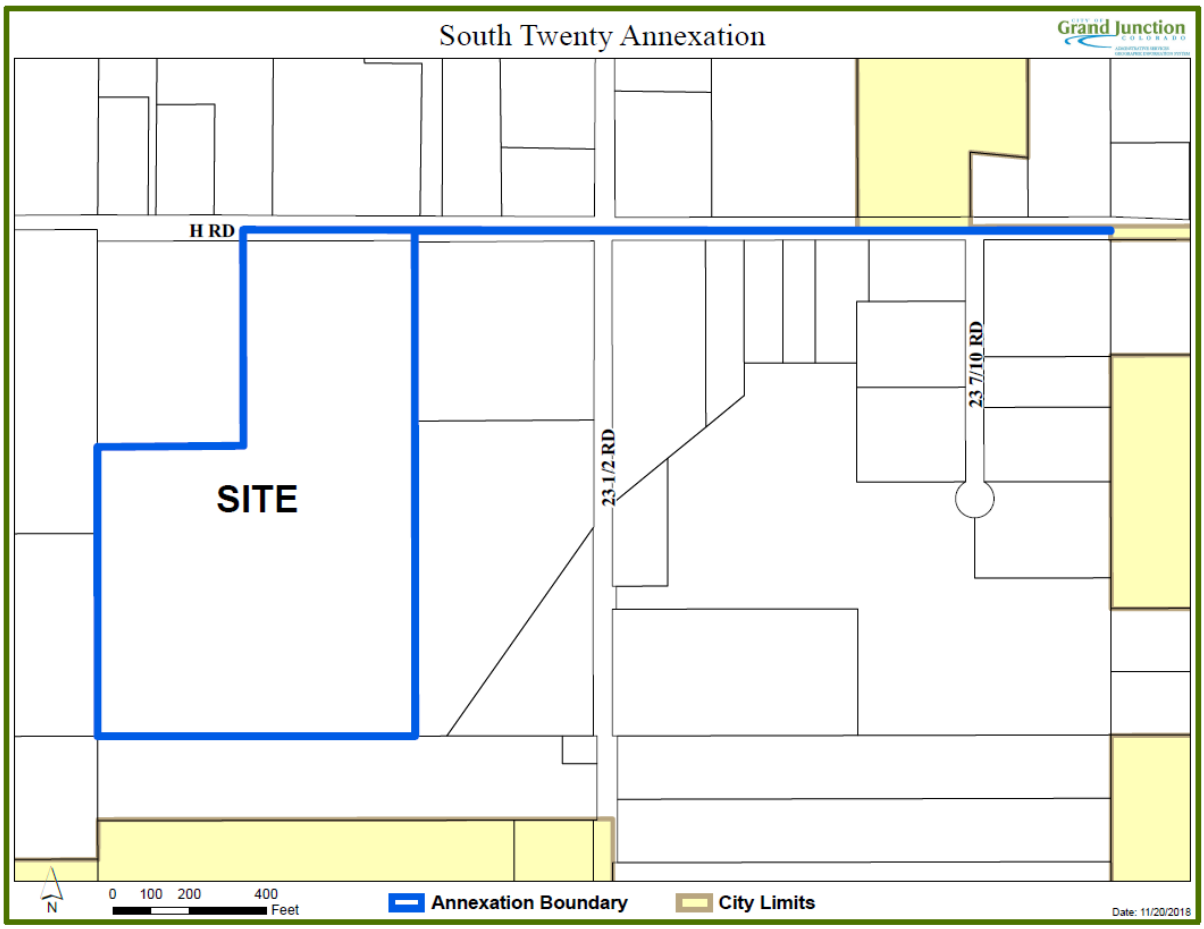
The fire department has only responded to this location twice in the last 11 years and with an estimated build of 96 units would predict a slight annual increase of 10-15 fire or EMS incidents as a result of this development. The area is served by Fire Station #3 located at 582 25 ½ Road and response times are longer than other areas due to the distance from existing fire stations. Evaluating the last two years of fire and EMS incident data, shows an average response time to this area of 12 minutes and 33 seconds, which is significantly longer than National Fire Protection Association response time standards. This response time is also approximately 8 minutes and 5 seconds longer than for the core area of the City. The City has been working to address the current and future fire and EMS coverage demands of this area and is planning for a new Fire Station immediately adjacent to this property on the west side of 23 and H Road.

Annual Maintenance costs for the 443 linear feet of pavement on H Road Rd is estimated at approximately $45/year to sweep, remove snow, stripe and sign. Future chipseal costs for this road is estimated at $1,490 and is planned as part of this area's normal chip seal cycle in the next five years. Estimated cost of the maintenance of borrow ditches is approximately $75/year on average.

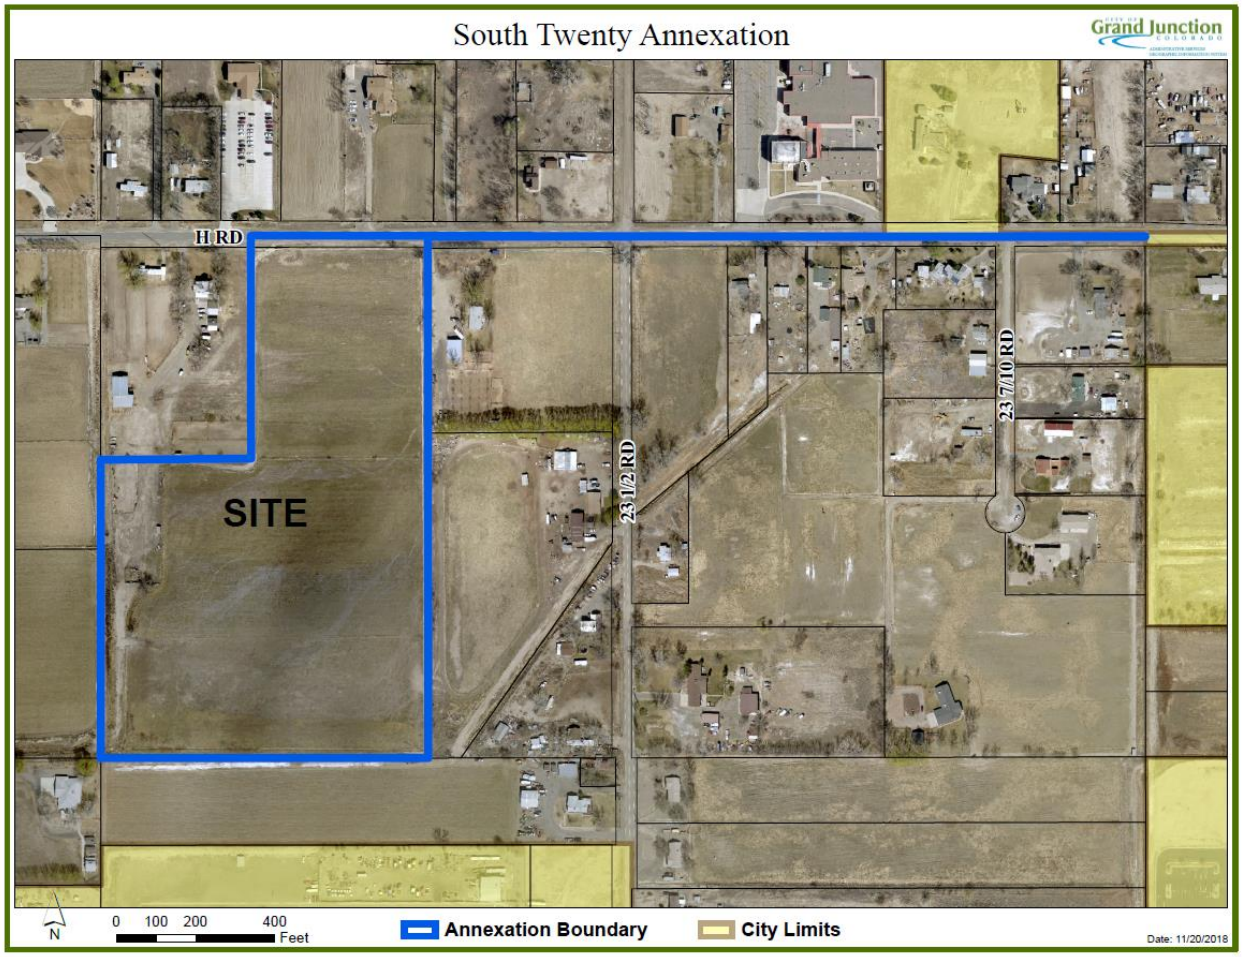
The cost to improve the road frontage to accommodate the left turn into the development is estimated at $140,000. Under current Transportation Capacity Payment policies, this work is the responsibility of the City.



SUGGESTED MOTION:



I move to introduce an ordinance zoning the South Twenty Annexation to R-4



(Residential – 4 du/ac) and R-8 (Residential – 8 du/ac), located at 2335 H Road and set a public hearing for March 6, 2019.

CITY OF GRAND JUNCTION, COLORADO

ORDINANCE NO. _____

AN ORDINANCE ZONING THE SOUTH TWENTY ANNEXATION TO R-4 (RESIDENTIAL – 4 DU/AC) & R-8 (RESIDENTIAL – 8 DU/AC)

LOCATED AT 2335 H ROAD

Recitals

The property owners have requested annexation of the 19.76-acre property into the City limits in anticipation of future residential subdivision development

After public notice and public hearing as required by the Grand Junction Zoning & Development Code, the Grand Junction Planning Commission recommended approval of zoning the South Twenty Annexation to the R-4 (Residential – 4 du/ac) and R-8 (Residential – 8 du/ac) zone district respectfully, finding that it conforms with the split designation of Residential Medium (4 – 8 du/ac) and Residential High Mixed Use (16 - 24 du/ac) as shown on the Future Land Use Map of the Comprehensive Plan and the Comprehensive Plan's goals and policies and is generally compatible with land uses located in the surrounding area.

After public notice and public hearing, the Grand Junction City Council finds that the R-4 (Residential – 4 du/ac) and R-8 (Residential – 8 du/ac) zone districts are in conformance with at least one of the stated criteria of Section 21.02.140 of the Grand Junction Zoning & Development Code.

BE IT ORDAINED BY THE CITY COUNCIL OF THE CITY OF GRAND JUNCTION THAT:

SOUTH TWENTY ANNEXATION

The following portion of the property be zoned R-4 (Residential – 4 du/ac). See Exhibit A.

A tract of land situated in the Northeast Quarter of Northwest Quarter of Section 32, Township 1 North, Range 1 West of the Ute Meridian and being a part Parcel 1 Muller Simple Land Division as recorded at Reception Number 1933582 of the Mesa County Records, County of Mesa, State of Colorado and being more particularly described as follows:

Commencing at the Northeast corner of said Parcel 1 thence S0°02'51"E along the East line of said Parcel 1a distance of 535.79 feet to the Point of Beginning; thence S0°02'51"E along the East line of said Parcel 1a distance of 754.98 feet to the Southeast corner of said Parcel 1; thence N89°58'25"W along the South line of said

Parcel 1 a distance of 826.14 feet to the Southwest corner of said parcel 1 and the Northwest Sixteenth Corner of said Section 32; thence N0°04'55"E along the West line of said Parcel 1 a distance of 755.07 to an angle point on the West line of said Parcel 1; thence S89°58'03"E a distance of 379.71 feet to an angle point on the West line of said Parcel 1; thence S89°58'01'E a distance of 444.72 feet to the Point of Beginning.

Said tract of land contains 14.30 acres as described.

The following portion of the property be zoned R-8 (Residential – 8 du/ac). See Exhibit B.

A tract of land situated in the Northeast Quarter of Northwest Quarter of Section 32, Township 1 North, Range 1 West of the Ute Meridian and being a part Parcel 1 Muller Simple Land Division as recorded at Reception Number 1933582 of the Mesa County Records, County of Mesa, State of Colorado and being more particularly described as follows:

Beginning at the Northeast corner of said Parcel 1 thence S0°02'51"E along the East line of said Parcel 1a distance of 535.79 feet; thence N89°58'01"W a distance of 444.72 feet to an angle point on the West line of said Parcel 1; thence N0°05'02"E along the West line of said Parcel 1 a distance of 535.79 feet to the Northwest corner of said Parcel 1; thence S89°58'01'E along the North line of said Parcel 1 a distance of 443.49 feet to the Point of Beginning.

Said tract of land contains 5.46 acres as described.

GRAND JUNCTION PLANNING COMMISSION
February 12, 2019 MINUTES
6:00 p.m.

The meeting of the Planning Commission was called to order at 6:00 p.m. by Vice Chairman Wade.

Those present were Planning Commissioners; Bill Wade, George Gatseos, and Kathy Deppe, Keith Ehlers and Steve Tolle.

Also present were Community Development Department, Tamra Allen, Tom Dixon (Senior Planner), Andrew Gingerich (Associate Planner), Kristen Ashbeck (Senior Planner), and Scott Peterson (Senior Planner).

Deputy City Attorney Jamie Beard and Secretary Lydia Reynolds.

There were approximately 5 citizens in attendance during the meeting.

1. Minutes of Previous Meetings

The Planning Commission reviewed the meeting minutes from the January 22, 2019 meeting.

Vice Chairman Wade asked for a motion to approve the minutes. Commissioner Gatseos noted Commissioner Keith Ehlers needed to be added to those in attendance. Commissioner Gatseos moved to approve the minutes as corrected. Commissioner Tolle seconded the motion.

The motion passed unanimously by a vote of 5-0.

2. Sugar Beet Building ROW/Easement Vacation FILE # VAC-2018-704

Consider a request to 1) vacate a four-foot portion of the public right-of-way, 2) vacate the existing 14-foot wide multi-purpose easement (MPE), and 3) dedicate a new multi-purpose easement with a minimum width of eight feet on the south side of the new right-of-way for properties at 1015 and 1101 Kimball Avenue.

Commissioners accepted two new exhibits, one from CenturyLink and the other the application form.

Staff Presentation

Senior Planner Tom Dixon presented the staff report showing pictures of the site and recommending approval based on the criteria within the Code.

Commissioner Ehlers asked a question regarding the cross section of a Local Road as well as the location of the multi purpose easement along Riverside Parkway.

Applicant Presentation
The Applicant's representative Lisa Cox with Vortex Engineering was present and did a brief presentation highlighting the request to vacating what they call surplus right-of-way.

Public Comment
No public comment was received.

Questions for Staff
No addition questions were asked of staff.

Commissioner Discussion
Commissioner Ehlers noted the atypical width was deferred to and decided by the Alternative Streets Committee. No further discussion was had.

Motion and Vote
Commissioner Gatseos made the following motion: Mister Vice Chairman, on the request to 1) vacate a four-foot portion of the public right-of-way, 2) vacate the 14-foot multi-purpose easement, and 3) create a new multi-purpose with a minimum width of eight feet on the south side of the new edge of right of way for Kimball Avenue starting from the easterly edge of the South 12th Street alignment and extending 1,177 feet to its westerly terminus point, as reviewed under case file VAC-2018-704, I move that the Planning Commission forward a recommendation of approval with the findings of fact in the staff report and the following condition: The existing 14-foot wide multi-purpose easement shall be eliminated and a new multi-purpose easement shall be dedicated from the new edge of Kimball Avenue southward for 8 feet. Commissioner Ehlers seconded the motion.

The motion passed by a vote of 5-0.

3. Amend 7th St Guidelines/Standards FILE# PLD-2019-14
Consider a request for an amendment to a Planning Development (PD) zone district concerning the North Seventh Street Historic Residential District Guidelines and Standards pertaining to vinyl fencing within the District

Staff Presentation
Senior Planner Kristen Ashbeck presented the request to prohibit vinyl fencing in the historic district, a PD. Ms. Ashbeck also represented the Historic Preservation Board who initiated the request on behalf of the Board and the City. She noted that a survey was sent originally to gauge property owner's support as well as public notice was mailed twice to all property owners within the PD, providing significantly more notice than is required by Code. Staff recommended approval of the request.

Questions for Staff
Commissioner Ehlers asked why it wasn't allowed for vinyl fencing in areas that were not visible. Ms. Ashbeck responded.

Public Comment
No public comment was received.

Commissioner Discussion
Commissioner Deppe stated support to not allow vinyl fencing because it was not a historical material. Commissioner Ehlers stated he supported this but was weary of stifling property rights. Commissioner Gatseos stated he thought the HPB included sufficient outreach to the neighborhood.

Motion and Vote
Commissioner Deppe made the following motion: Mister Vice Chairman, on the proposed amendment to the Planned Development (PD) ordinance for the North Seventh Street Historic Residential District regarding the use of vinyl fencing on properties within the District (PLD-2019-14), I move to recommend approval of the amended ordinance to City Council. Commissioner Tolle seconded the motion.

The motion passed unanimously by a vote of 5-0.

4. 746 23 1/2 Road RV Resort Rezone FILE# RZN-2018-785
Consider a request by Western Slope Properties, LLC to Rezone two properties, 746 23 ½ Road and a contiguous unaddressed property to the north, totaling 20.2 acres, from M-U (Mixed Use) to C-2 (General Commercial).

Staff Presentation
Associate Planner Andrew Gingerich read the list of exhibits and made a presentation recommending approval of the rezone request.

Applicant Presentation
Lisa Cox from Vortex Engineering representing the Applicant presented on the request. Ms. Cox noted they concurred with Staff's recommendation and findings.

Questions to Staff
Commissioner Ehlers asked if the split diamond configuration that CDOT previously proposed at 24 Road would impact this site. Staff noted they could research this and provide information on this topic as part of the City Council staff report if the double diamond was still proposed.

Public Comment
No public comment was received.

Commissioner Discussion
No additional discussion was had.

DRAFT

Motion and Vote
Commissioner Deppe made the following motion, Mister Vice Chairman on the Rezone request RZN-2018-785, I move that the Planning Commission forward a recommendation of approval for the Rezone of the 20.2-acre properties located at 746 23 ½ Road and the unaddressed contiguous parcel to the north from the M-U (Mixed Use) zone district the C-2 (General Commercial) zone district, with the findings of fact listed in the staff report. Commissioner Gatseos seconded the motion.

The motion passed unanimously by a vote of 5-0.

5. Rehearing South Twenty Zone of Annexation FILE# ANX-2018-659
A rehearing to consider a request to zone approximately 19.76-acres from County RSF-R (Residential Single Family – Rural) to a City R-4 (Residential – 4 du/ac) and R-8 (Residential – 8 du/ac) for the South Twenty Annexation, located at 2335 H Road.

Staff Presentation
Senior Planner Scott Peterson presented this request, noting that this was a rehearing of this item that was remanded back to the Planning Commission by the City Council at their February 6th meeting.

Questions for Staff
Commissioner Deppe asked what the other surrounding properties would be zoned if they were annexed. Commissioner Ehlers asked what zone designation could be applied when a property is split by a future land use designation. Staff noted, the property owner has a choice and can choose either designation and be compatible with the Comprehensive Plan.

Applicant Presentation
Mandy Rush, part owner of the property and representing the Applicant noted that they worked with the neighboring property owners to try to find a balance between existing character of neighborhood and the Comprehensive Plan's higher density.

Public Comment
Kathy Tomkins property owner directly adjacent to the west of the subject property. She indicated the neighborhoods' preference for R-4 due to traffic, rural character and school enrollment.

Commissioner Discussion
Commissioner Ehlers stated he had previously misunderstood the ability for the Applicant to seek a zone category consistent with the land use designation that was not only on the property but also a designation that was adjacent to the property. He apologized for the delays to the project and his previous vote to not approve the rezone.

Commissioner Gatseos noted he has visited the site and observed that the area was changing and therefore was supportive of the rezone request.

Commissioner Deppe noted she thought the Applicant had worked well with the City to meet the intent of the Comprehensive Plan and find a compromise between the R-4 and higher density R-8 designation.

Commissioner Tolle thanked Ms. Rush for working with her neighbors and thought the zoning request was consistent with the Plan.

Commissioner Wade noted he was also in support of the request and concurred with the other Commissioner's comments.

Motion and Vote

Commissioner Ehlers made the following motion: Mister Vice Chairman, on the Zone of Annexation for the South Twenty Annexation to R-4 (Residential – 4 du/ac) & R-8 (Residential – 8 du/ac) zone district, file number ANX-2018-659, I move that the Planning Commission forward a recommendation of approval to City Council with the findings of fact listed in the staff report. Commissioner Deppe seconded the motion.

The motion passed unanimously by a vote of 5-0.

Other Business

Adjournment

The meeting was adjourned at 7:50.

Regular Session

Item #2.a.iv.

Meeting Date: February 20, 2019

Presented By: Kathy Portner, Community Services Manager

Department: Community Development

Submitted By: Kathy Portner

Information

SUBJECT:

Introduction of an Ordinance Vacating a Portion of the Dos Rios Drive and C 3/4 Road Right-of-Way Within the Jarvis Subdivision Plat, Located at 2595 Riverside Parkway, and Set a Public Hearing for March 6, 2019

RECOMMENDATION:

Planning Commission will make a recommendation at their February 26, 2019 meeting.

EXECUTIVE SUMMARY:

The City-owned 60-acre site, located between Highway 50 and the Riverside neighborhood along the Colorado River, was recently platted to accommodate future redevelopment. Dos Rios Drive was dedicated on the original plat to provide access from Riverside Parkway to the pre-existing C ¾ Road right-of-way. Refinements to the Dos Rios development plan necessitate the slight realignment of Dos Rios Drive and C ¾ Road to accommodate the redevelopment.

BACKGROUND OR DETAILED INFORMATION:

The City acquired the 60-acre Dos Rios site (formerly known as the Jarvis property) in the 1990s. The property is located on the north bank of the Colorado River between the Highway 50/railroad bridge and the Riverside neighborhood. Since that time, the property has been cleared, the Riverfront Trail was extended, and a backwater pond for endangered fish was created between the trail and River. The remaining acreage was intended for redevelopment.

The property was recently platted to serve future redevelopment. Dos Rios Drive was

dedicated on the original plat to provide access from Riverside Parkway to the pre-existing C ¾ Road right-of-way. Refinements to the Dos Rios development plan necessitate the slight realignment of Dos Rios Drive and C ¾ Road to accommodate planned future redevelopment. The small areas to be vacated include 679 square feet of Dos Rios Drive and 1,024 square feet of C ¾ Road. The Riverfront at Dos Rios Filing Two replat will incorporate the vacated right-of-way into Lot 7. The Public Service Easement, per Book 1699, Page 739, will remain on the vacated C ¾ Road right-of-way. There are no utilities located within the right-of-way proposed to be vacated.

NOTIFICATION REQUIREMENTS

As required by Section 21.02.080(e) of the Zoning and Development Code, a Neighborhood Meeting was held on November 15, 2018 for the proposed Outline Development Plan/Planned Development that included the road realignment. Twenty-eight people attended the meeting along with City Staff. There were no objections noted to the Dos Rios development plans.

Notice was completed consistent to the provisions in Section 21.02.080 (g) of the City's Zoning and Development Code. Mailed notice of the application submittal in the form of notification cards was sent to surrounding property owners within 500 feet of the subject property and the subject property was posted with an application sign on February 15, 2019. The notice of this public hearing was published February 19, 2019 in the Grand Junction Daily Sentinel.

ANALYSIS
Pursuant to Section 21.02.100 of the Zoning and Development Code, the vacation of the right-of-way shall conform to the following:

a. The Comprehensive Plan, Grand Valley Circulation Plan, and other adopted plans and policies of the City.

The proposed right-of-way vacation is addressed by the following Goal of the Comprehensive Plan.

Goal 9: Develop a well-balanced transportation system that supports automobile, local transit, pedestrian, bicycle, air, and freight movement while protecting air, water and natural resources.

Policy C: The Regional Transportation Plan will be used as a basis for development review and to help prioritize capital improvement programming. The City and County will maintain Capital Improvement Plans (CIPs) which prioritize road and alley improvements based on needs for traffic flow, safety enhancements, maintenance and linkages.

Goal 11: Public facilities and services for our citizens will be a priority in planning for growth.

Vacation of the right-of-way will have no impact on public facilities or services provided to the general public and will enhance the redevelopment efforts. Staff therefore finds this request conforms with this criterion.

b. No parcel shall be landlocked as a result of the vacation.

The request to vacate portions of the right-of-way will not render any parcel landlocked. Therefore, staff finds the vacation request meets with this criterion.

c. Access to any parcel shall not be restricted to the point where access is unreasonable, economically prohibitive or reduces or devalues any property affected by the proposed vacation.

No access to any parcel will be restricted by the right-of-way vacation. Staff finds this criterion has been met.

d. There shall be no adverse impacts on the health, safety, and/or welfare of the general community and the quality of public facilities and services provided to any parcel of land shall not be reduced (e.g. police/fire protection and utility services).

The right-of-way vacation will allow for better alignment of the public street that will serve the Dos Rios development and the existing Public Service easement will be retained; therefore, there will be no adverse impacts to the community and no impacts on the public facilities and services that serve this or any adjacent parcel of land.

Staff therefore has found this request conforms with this criterion.

e. The provision of adequate public facilities and services shall not be inhibited to any property as required in Chapter 21.06 of the Grand Junction Municipal Code.

Adequate public facilities and services exist for these properties, or will be extended with the development of the property and as such provision of services shall not be inhibited to any property. Staff has therefore found this request to conform with this criterion.

f. The proposal shall provide benefits to the City such as reduced maintenance requirements, improved traffic circulation, etc.

Vacation of this right-of-way will provide benefit to the City by allowing for the

realignment of the access into this portion of the site; thereby enhancing the redevelopment opportunities. Staff finds this request conforms with this criterion.

STAFF RECOMMENDATION AND FINDINGS OF FACT

After reviewing VAC-2019-41, a request to vacate a portion of the public right-of-way for Dos Rios Drive and C ¾ Road to realign the street, the following findings of fact were made:

1. The request conforms with Section 21.02.100 (c) of the Grand Junction Zoning and Development Code;

Therefore, staff recommends approval of the request to vacate the right-of-way.

FISCAL IMPACT:

This land use action does not have any direct fiscal impact.

SUGGESTED MOTION:

I move to introduce an ordinance vacating a portion of the Dos Rios Drive and C 3/4 Road right-of-way within the Jarvis Subdivision Plat, located at 2595 Riverside Parkway and set a public hearing for March 6, 2019.

CITY OF GRAND JUNCTION, COLORADO

ORDINANCE NO. _____

AN ORDINANCE VACATING A PORTION OF THE DOS RIOS DRIVE AND C ¾ ROAD RIGHT-OF-WAY WITHIN THE JARVIS SUBDIVISION PLAT, LOCATED AT 2595 RIVERSIDE PARKWAY

Recitals:

The City acquired the 60-acre Dos Rios site in the 1990s. The property is located on the north bank of the Colorado River between the Highway 50/railroad bridge and the Riverside neighborhood. Since that time, the property has been cleared, the Riverfront Trail was extended, and a backwater pond for endangered fish was created between the trail and River. The remaining acreage was intended for redevelopment.

The property was recently platted to serve future redevelopment. Dos Rios Drive was dedicated on the original plat to provide access from Riverside Parkway to the pre-existing C ¾ Road right-of-way. Refinements to the Dos Rios development plan necessitate the slight realignment of Dos Rios Drive and C ¾ Road to accommodate the redevelopment. The small areas to be vacated include 679 s.f. of Dos Rios Drive and 1,024 s.f. of C ¾ Road. The Riverfront at Dos Rios Filing Two replat will incorporate the vacated right-of-way into Lot 7. The Public Service Easement, per Book 1699, Page 739, will remain on the vacated C ¾ Road right-of-way. There are no utilities in the right-of-way to be vacated.

After public notice and public hearing as required by the Grand Junction Zoning and Development Code, and upon recommendation of approval by the Planning Commission, the Grand Junction City Council finds that the request to vacate certain right-of-way within the Jarvis Subdivision plat is consistent with the Comprehensive Plan, the Grand Valley Circulation Plan and Section 21.02.100 of the Grand Junction Municipal Code.

NOW, THEREFORE, BE IT ORDAINED BY THE CITY COUNCIL OF THE CITY OF GRAND JUNCTION THAT THE FOLLOWING DESCRIBED DEDICATED RIGHT-OF-WAY IS HEREBY VACATED:

A certain parcel of land lying in the Northeast Quarter of the Northeast Quarter (NE 1/4 NE 1/4) of Section 22, Township 1 South, Range 1 West of the Ute Principal Meridian and lying entirely within Lot 7, Jarvis Subdivision Filing One, as same is recorded with Reception No. 2790938, Public Records of Mesa County, Colorado and being more particularly described as follows:

BEGINNING at the Southwest corner of said Lot 7 and assuming the South line of said Lot 7 bears N 89°57’26” W with all other bearings contained herein are relative thereto; thence from said Point of Beginning, N 00°02’34” E, along the West line of said Lot 7, a distance of 52.22 feet; thence S

51°40’32” E, a distance of 46.28 feet to a point being the beginning of a 204.32 foot radius curve, concave Northeast, whose long chord bears S 58°00’47” E with a long chord length of 44.50 feet; thence Southeasterly along the arc of said curve, thru a central angle of 12°30’11”, an arc length of 44.59 feet, more or less, to a point on the South line of said Lot 7; thence N 89°57’26” W, along said South line, a distance of 74.09 feet, more or less, to the Point of Beginning.

See Exhibit A.

Submitted By: Kathy Portner

Information

SUBJECT:

Introduction of an Ordinance Establishing an Institutional and Civic Master Plan for the Grand Junction Regional Airport, Amending Ordinance No. 3679 for Planned Development and Outline Development Plan and Vacating a Portion of the 27 1/4 Road Right-of-Way Adjacent to Airport Property, and Set a Public Hearing for March 6, 2019

RECOMMENDATION:

Planning Commission will make a recommendation at their February 26, 2019 meeting.

EXECUTIVE SUMMARY:

The proposed Institutional and Civic Master Plan for the Grand Junction Regional Airport includes two components: the 2009 Airport Master Plan Update and the 2011 Terminal Area Plan and 2017 Amendment. The update addresses forecasting of future aviation activity, which serves as the basis for the facility improvements necessary to meet the needs. The Terminal Plan includes both the long term needs for the replacement of the terminal building, as well as the near-term improvements needed to maintain safe and efficient operation of the existing building until funding is available for its replacement.

Ordinance No. 3679, adopted in 2004, established standards for the Planned Development (PD) zone district for the Airport property based on three zones, 1. Aeronautical, 2. Aeronautical/Commercial and 3. Non-aeronautical. Modifications proposed for the ordinance include placing the partially constructed Administration Building in the Non-aeronautical/Commercial zone and modifying the review process to be consistent with the current Zoning and Development Code which allows for administrative review of future development.

The Plan also includes the relocation of a section of 27 ¼ Road around the west end of the new runway protection zone for the proposed runway 11/29. Approximately 1 mile of the existing 27 ¼ Road will be realigned to swing to the west around the runway zone. The proposed ordinance to vacate the existing section of 27 ¼ Road that is being realigned is conditioned on the acceptance of the realigned improvements, completion of the land patent transfer of property to the Airport and the dedication of right-of-way for the new alignment.

BACKGROUND OR DETAILED INFORMATION:

Institutional and Civic Master Plan
The Grand Junction Regional Airport Authority (GJRAA) updated the Airport Master Plan in early 2009 and submitted it to the City for review pursuant to the Institutional and Civic Master Plan provisions of the Zoning and Development Code Section 21.02.190 in September of 2010. During the review process, the GJRAA initiated a study of the existing passenger terminal facilities and alternatives for improvements to the terminal building and adjacent facilities and determined it would be best to delay consideration of the Institutional and Civic Master Plan until the completion of the Terminal Area Plan so that it could be integrated into the Master Plan. The revised Institutional and Civic Master Plan was submitted to the City in April of 2012, which was reviewed by the Planning Commission in November of 2012 with a recommendation of approval. However, before it could be reviewed by the City Council, the application was withdrawn by GJRAA due to the Airport contemplating further refinements to the plan, including drainage for the runway realignment project, design and realignment of 27 ¼ Road and the changed status of the unfinished Administration Building.

The proposed Institutional and Civic Master Plan includes two components: the 2009 Airport Master Plan Update and the 2011 Terminal Area Plan and 2017 Amendment. The update addresses forecasting of future aviation activity, which serves as the basis for the facility improvements necessary to meet the needs. A key element to forecasts is passenger enplanements (the number of passengers that board an aircraft and depart from the Airport), which is used to determine the future capacity of facilities such as the passenger terminal, public parking, rental car, and other facilities that serve commercial passengers. Passenger enplanements are estimated to increase from 170,836 to approximately 371,423 over the 20-year planning period.

The Terminal Plan includes both the long term needs for the replacement of the terminal building, as well as the near-term improvements needed to maintain safe and efficient operation of the existing building until funding is available for its replacement. The primary purpose of the Airport Master Plan Update is to reserve space for future airport facilities. The improvements listed in the plan would be constructed on a phased basis in accordance with demonstrated need and available funding. Key improvements recommended are as follows:

Key Improvements Recommended in the Airport Master Plan Update
• Relocate runway 11/29 and the associated taxiway system laterally 600 feet to the northeast and longitudinally 1,000 feet to the northwest;
• Potential expansion of general aviation hangar facilities and related apron space;
• Potential new Air Traffic Control Tower;
• Relocate 27 ¼ Road around the west end of the new runway protection zone for the relocated runway 11/29;
• Continue to reserve space for a second parallel 11/29 runway (not expected to be constructed with the 20-year planning period).

Key Improvements Recommended in the Terminal Area Plan (long-term)
• Construct the Terminal Building Expansion, Phase I, located southeast of the existing terminal building;
• Construct Terminal Building Phase II (replace existing passenger terminal building) with a new facility also to the southeast of the existing terminal building;
• Potential construction of a 3-story parking structure just to the northwest of the existing passenger terminal building. The parking structure could contain up to 900 additional parking spaces;
• Improve unpaved overflow parking area to provide 160 additional surface parking spaces similar to the existing public parking lot;
• Expansion of the de-ice pad to the southeast of the existing de-icing pad.

Key Improvements Recommended in the Terminal Area Plan Amendment (near-term)
• Total redesign and replacement of the mechanical heating, ventilation, and air conditioning or HVAC system serving the main building entrance area and atrium;
• Identify and eliminate water penetration under the Terminal Building and consider other measures to stabilize the structure;
• Install smoke evacuation system for the atrium, fire alarm upgrades and emergency and egress lighting;
• Roof repairs and replacement of the escalators in the main lobby;
• Consider installing passenger corridors leading to boarding bridges for both Gates 1 and 2 and a passenger boarding tunnel at Gate 1 to bridge the distance from the lower departure lounge to the aircraft.

The partially constructed Administration Building is also addressed in the Plan. As stated in the Plan, the building is located in the Aeronautical zone and, in its current state, is occupying valuable space, degrading the visual character of the terminal area and creating liability issues for the Airport. The GJRAA is exploring solutions to complete the building and put it to beneficial use through a potential public/private partnership to finish the building for a mix of uses, including airport functions, general office and restaurant. To be considered for those types of uses, the building and surrounding area must be removed from the Aeronautical zone and placed in the Non-

aeronautical/Commercial zone. In addition, the Plan also anticipates non-aviation development of the area between H Road and the airport parking lot.

Amending Ordinance No. 3679, Planned Development
Ordinance No. 3679, adopted in 2004, established standards for the Planned Development (PD) zone district for the Airport property based on three zones, 1. Aeronautical, 2. Aeronautical/Commercial and 3. Non-aeronautical. Modifications proposed for the ordinance include placing the partially constructed Administration Building in the Non-aeronautical/Commercial zone and modifying the review process to be consistent with the current Zoning and Development Code which allows for administrative review of future development.

Zone 1 is considered the “air side” of airport operations and includes the bulk of the airport property, including the runways, terminal, as well as hangars and facilities with direct access to the ramp. Zone 2 includes the public parking lot and car rental area. All of the improvements recommended in the Airport Master Plan Update, Terminal Area Plan and Terminal Area Plan Amendment are located within the Aeronautical and Aeronautical/Commercial zones. Development in Zones 1 and 2 are specific to the internal functions of the Airport and, as such, subject to standards established and administered by the GJRAA. City review will be limited to access, drainage and stormwater management, provision of services and utilities, and adherence to the Fire and Building Code. Signage must meet City standards for any signs proposed along City public right-of-way.

Zone 3 is the non-aeronautical area located along H Road, proposed for a variety of commercial/industrial uses compatible and complimentary to the Airport uses. Allowed uses, standards and review shall be in conformance with the C-1 zone district.

Vacation of Right-of-Way
The Plan also includes the relocation of a section of 27 ¼ Road around the west end of the new runway protection zone for the proposed runway 11/29. Approximately 1 mile of the existing 27 ¼ Road will be realigned to swing to the west around the runway zone. A portion of the new roadway crosses BLM property and is subject to a land patent that is currently under review and should be finalized by summer of 2019. Pending approval of the land patent for the transfer of the property, the BLM has issued the Airport a ROW grant for the portion of the 27 ¼ Road that is on BLM property. The environmental review and Finding of No Significant Impact has already been completed for the land transfer.

Construction of the newly aligned 27 ¼ Road is nearing completion. The proposed ordinance to vacate the existing section of 27 ¼ Road that is being realigned is conditioned on the acceptance of the realigned improvements, completion of the land patent transfer of property to the Airport and the dedication of right-of-way for the new

alignment.

NOTIFICATION REQUIREMENTS
As required by § 21.02.080 (e) of the Zoning and Development Code a Neighborhood Meeting was held on May 3, 2018. Eight people attended the meeting along with City Staff. Airport staff was available to discuss future plans for the airport. There were no specific issues or concerns identified by those who attended.

Notice was provided in accordance with §21.02.080 (g) of the Zoning and Development Code. On February 1, 2019 notice of the application was mailed to property owners within 500 feet of the subject property. An application sign was posted on the property on or before February 1, 2019 and notice of the public hearing was published February 5, 2019 in the Daily Sentinel.

ANALYSIS – Institutional and Civic Master Plan
Section 21.02.190 (c) of the Grand Junction Zoning and Development Code:

In reviewing a Master Plan, the decision-making body shall consider the following:

(1) Conformance with the Comprehensive Plan and other area, corridor or neighborhood plans;

The Airport is located within the Urban Development Boundary and the property and some adjacent areas are designated as “Airport” on the Future Land Use Map. In addition, the improvements identified in the Airport Master Plan are designed to accommodate the level of growth anticipated in the Comprehensive Plan. The Airport Master Plan is consistent with the following Goals and Policies of the Comprehensive Plan.

Goal 7: New development adjacent to existing development (of a different density/unit type/land use type) should transition itself by incorporating appropriate buffering.
Policy A: In making land use and development decisions, the City and County will balance the needs of the community.

The Airport’s location at the north edge of the City with surrounding BLM land is ideal for minimizing impacts to the community. In addition, the runway system is oriented to minimize over-flight of residential areas as much as possible and the additional airport land southwest of the commercial runway (11/29) provides a buffer to the residents in the Grand Vista, Garfield Estates, Summer Hill and Paradise Hills neighborhoods. The recommended runway relocation will move runway 11/29 six-hundred feet further from these neighborhoods.

Goal 8: Create attractive public spaces and enhance the visual appeal of the

community through quality development.
Policy A: Design streets and walkways as attractive public spaces.

Improvements contemplated in the Airport Master Plan will continue to improve and enhance the aesthetic appeal of the public spaces, including the internal street system, entries, parking areas and the redevelopment of the main terminal building. In addition, the GJRAA has developed a set of design guidelines to ensure quality development, which include the following goals:
• Reinforce a positive and memorable experience for visitors;
• Convey an image of quality development for the Airport, its passengers, visitors, tenants, and the community;
• Maintain a consistent campus appearance through complimentary design of site, signage, landscape, and building development;
• Allow and encourage development with creative and compatible design solutions;
• Encourage a “regional contemporary” architectural style;
• Provide for development and construction which allows for minimal impact to airport operations.

Goal 9: Develop a well-balanced transportation system that supports automobile, local transit, pedestrian, bicycle, air, and freight movement while protecting air, water and natural resources.

The Grand Junction Regional Airport is a vital component of the transportation system and a valuable asset to the City and surrounding region and the improvements contemplated in the Master Plan will meet the community’s air transportation and air freight needs. The recommended improvements have been evaluated for impacts to a wide range of environmental factors and some improvements, such as the runway relocation, will also be subject to further environmental review in accordance with NEPA regulations.

Goal 12: Being a regional provider of goods and services the City and County will sustain, develop and enhance a healthy, diverse economy.

The Grand Junction Regional Airport provides airline passenger and air freight service to the City and surrounding region. The annual economic benefits of the Airport on the local and regional economy were estimated at nearly $400,000,000 in the 2013 Colorado Airports Economic Impact Study.

Therefore, this criterion has been met.

(2) Conformance with the Grand Valley Circulation Plan and general transportation planning requirements;

The Grand Junction Circulation Plan identifies streets surrounding the Airport as follows: Horizon Drive as a minor arterial, H Road as a principal arterial, and 12th Street and 27 Road southwest of the airport as a major collector. The Grand Junction Circulation Plan also identifies future roads and connections, including a new interchange with Interstate 70 at 29 Road, a Principal Arterial connecting the 29 Road Interchange with the existing Clifton Interchange, and a proposed Major Collector between the 29 Road Interchange and H Road adjacent to I-70, skirting the perimeter of the airport property around Runway 4/22. The Major Collector shown through the Airport property presents some issues for the Airport since the use of airport property for non-aeronautical purposes requires approval from the FAA. As a result, the Airport Master Plan does not show the road alignment at this time. However, the GJRAA continues to be willing to work with the City and other entities on the planning studies for the 29 Road interchange and the connection to H Road to the west.

Therefore, the criterion has been met.

(3) Adequate parking, adequate stormwater and drainage improvements, minimization of water, air or noise pollution, limited nighttime lighting and adequate screening and buffering potential;

Parking: The Plan includes the provision of additional parking to meet the needs of the forecasted increase in enplanements, including improvements to the overflow public parking lot and a future parking structure. Parking improvements would be phased based on need and funding availability.

Stormwater and drainage improvements: A Master Drainage Report is a part of the Master Plan which addresses hydrology and drainage for the ultimate build-out of the Airport. Also included is the Conceptual Drainage Report for the Runway 11/29 Relocation Program that focuses on the drainage design for the project. Final drainage reports will be required with each specific project and stormwater permits through the State of Colorado and 521 Drainage Authority must be obtained in accordance with City standards.

Minimization of water, air or noise pollution: These environmental issues have been addressed in the reports submitted for review. The proposed terminal area projects are not anticipated to have an unusual impact on the drainage systems in the area. Any construction requiring earthwork will require stormwater detention and erosion control, which the City and/or drainage authority will review as required. The proposed airport expansions are not expected to have a significant impact on the long-term quality of the air in the vicinity of the Airport. These are discussed in Chapter E of the GJRAA Airport Master Plan update and in Chapter F (Environmental Review) of the 2011 Terminal Area Plan.

Lighting, screening and buffering: Airfield lighting and rotating beacons are the main sources of light emissions emanating from an airport. Proposed future development is not expected to significantly change the visual impact of the airport facility lighting. Lighting and visual impacts are addressed in Chapter E of the Airport Master Plan Update and Chapter F of the Terminal Area Plan.

Therefore, this criterion has been met.

(4) Adequacy of public facilities and services; and

All major utilities are available to the airport property and provided to the airport facilities. Water service is provided by the Ute Water Conservancy District, sanitary sewer service is provided by the City of Grand Junction and Xcel Energy provides gas and electric. Public facilities and services are sufficient for the proposed expansions of the airport facilities and are addressed in the Master Utility Report included as an appendix of the Master Plan. The Airport is equipped to handle firefighting needs within the airport property and provides security services for both airside and landside facilities. General public safety and emergency medical services are provided by the City. The need for these services is infrequent and is not expected to increase significantly with the proposed improvements contemplated for the 20-year planning horizon.

Therefore, this criterion has been met.

(5) Community benefits from the proposal.

The Airport, along with the aviation-related businesses and facilities, represents a vital and significant regional economic asset by providing commercial passenger service, general aviation facilities, air cargo, and a small amount of military activity. In addition, the Airport also provides benefits to the local businesses and industries, promotes tourism, and encourages additional business development and expansion throughout Grand Junction and the surrounding region. The 2013 Colorado Airports Economic Impact Study quantified the total impact of the Grand Junction Regional Airport at 2,871 jobs, with a total payroll of $130,775,972 and a total economic output of $380,039,796.

The Master Plan accommodates aircraft operations and the traveling public with great reliability and safety and makes the most efficient use of the available land for aviation related activities and supporting uses by defining improvements necessary to meet future needs.

Therefore, this criterion has been met.

ANALYSIS—Amending Ordinance 3679, Planned Airport Development
Ordinance No. 3679, adopted in 2004, established standards for the Planned Development (PD) zone district for the Airport property based on three zones, 1. Aeronautical, 2. Aeronautical/Commercial and 3. Non-aeronautical. Modifications proposed for the ordinance include placing the partially constructed Administration Building in the Non-aeronautical/Commercial zone and modifying the review process to be consistent with the current Zoning and Development Code which allows for administrative review of future development.

Pursuant to Section 21.02.150 (b) (2) of the Grand Junction Zoning and Development Code, requests for an Outline Development Plan (ODP) shall demonstrate conformance with all of the following:

a) The Comprehensive Plan, Grand Valley Circulation Plan and other adopted plans and policies;

See analysis for Institutional and Civic Master Plan above. Staff finds that this criterion has been met.

b) The rezoning criteria provided in Section 21.02.140 (a) of the Grand Junction Zoning and Development Code.

(1) Subsequent events have invalidated the original premises and findings; and/or
Since the original Planned Development ordinance was approved in 2004, a new Zoning and Development Code was adopted in 2010 that eliminated the requirement for final plan review to be considered by the Planning Commission. In addition, the Administration Building was constructed in the Aeronautical zone and it's now been determined that the intended use is not feasible; therefore, the request is to include it in the Non-aeronautical/Commercial zone to provide additional options for future use. These subsequent events have invalidated the original premises and findings and, therefore, Staff finds that this criterion has been met.
(2) The character and/or condition of the area has changed such that the amendment is consistent with the Plan; and/or
The proposed Institutional and Civic Master Plan includes two components: the 2009 Airport Master Plan Update and the 2011 Terminal Area Plan and 2017 Amendment. The update addresses forecasting of future aviation activity, which serves as the basis for the facility improvements necessary to meet the needs. A key element to forecasts is passenger enplanements (the number of passengers that board an aircraft and depart from the Airport), which is used to determine the future capacity of facilities such as the passenger terminal, public parking, rental car, and other facilities that serve commercial passengers. Passenger enplanements are estimated to increase from 170,836 to approximately 371,423 over the 20-year planning period.

Staff finds that the proposed Master Plan is responding to changing condition and needs of the Airport and that the amended PD ordinance is consistent with the Institutional and Civic Master Plan. Therefore, this criterion has been met.

(3) Public and community facilities are adequate to serve the type and scope of land use proposed; and/or

See analysis for Institutional and Civic Master Plan. Staff finds that this criterion has been met.

(4) An inadequate supply of suitably designated land is available in the community, as defined by the presiding body, to accommodate the proposed land use; and/or

Not applicable to this request.

(5) The community or area, as defined by the presiding body, will derive benefits from the proposed amendment.

See analysis for Institutional and Civic Master Plan. Staff finds that this criterion has been met.

c) The planned development requirements of Section 21.05.040 (f) of the Zoning and Development Code;

(1) Setback Standards. Principal structure setbacks shall not be less than the minimum setbacks for the default zone.

No changes to setbacks established with Ordinance 3679 are proposed. Setbacks in Zone 1 are 0' and setbacks in Zones 2 and 3 are those established with the C-1 zone district standards.

(2) Open Space. All residential planned developments shall comply with the minimum open space standards established in the open space requirements of the default zone.

This standard is not applicable to non-residential development.

(3) Fencing/Screening. Fencing shall comply with GJMC 21.04.040(i).

No changes are proposed to standards established with Ordinance 3679. Fencing and screening in Zone 1 will be determined by the GJRAA. Fencing and screening in Zones 2 and 3 will be as per Code.

(4) Landscaping. Landscaping shall meet or exceed the requirements of GJMC

21.06.040.

No changes are proposed to standards established with Ordinance 3679. Landscaping is not required in Zone 1. Landscaping requirements in Zones 2 and 3 will be as per Code.

(5) Parking. Off-street parking shall be provided in accordance with GJMC 21.06.050.

No changes are proposed to standards established with Ordinance 3679. Parking requirements in Zone 1 will be established and enforced by the GJRAA. Parking requirements in Zones 2 and 3 will be as per Code.

(6) Street Development Standards. Streets, alleys and easements shall be designed and constructed in accordance with TEDS (GJMC Title 29) and applicable portions of GJMC 21.06.060.
All streets located on GJRAA property are owned and maintained by the Authority. Additional streets and improvements will be determined by the Authority and FAA and will meet minimum access standards.
d) The applicable corridor guidelines and other overlay districts.
Section 21.07.030 of the Zoning and Development Code establishes the Airport Environs Overlay Zoning District that applies additional standards and requirements to properties located in close proximity to the Airport and its facilities. The purpose of the Overlay District is to protect public health, safety and welfare by regulating development and land use within noise sensitive areas and airport hazard areas, to ensure compatibility between the Airport and surrounding land uses, and to protect the Airport from incompatible encroachment.

The Overlay includes four subdistricts: Subdistrict A, Airport Area of Influence; Subdistrict B, Noise Zones; Subdistrict C, Critical Zone and Subdistrict D, Clear Zone. The Area of Influence is the area surrounding the Airport impacted or influenced by proximity of the Airport either by aircraft overflight, noise and/or vibrations. The Noise Zone includes the area within the 65 Ldn to 70 Ldn noise-exposure area. The Critical Zone is a rectangular-shaped zone located directly off the end of each runway's primary surface (or 200 feet from the end of pavement) which is critical to aircraft operations (i.e. more apt to have accidents within it because of the takeoff and landing mode in that particular area). The Clear Zone is a trapezoidal-shaped zone also beginning 200 feet from the end of the pavement, which is to remain clear of all above-ground obstructions or construction. The Clear Zone dimensions match the dimension of the Runway Protection Zone (RPZ) as shown on the Airport Layout Plan (ALP) and is fully accommodated on Airport property. The Overlay includes a land use compatibility standards matrix that identifies appropriate uses in each of the subdistricts.

Subdistricts B (Noise Zone), C (Critical Zone) and D (Clear Zone) will be altered as a result of the proposed runway relocation. Subdistrict A (Area of Influence) will not need to be altered since it is a large area and the runway is being relocated a comparatively small distance within this subdistrict. With the amended boundaries of the subdistricts, the proposed ODP meets this criterion.

e) Adequate public services and facilities shall be provided concurrent with the projected impacts of the development.

See analysis for Institutional and Civic Master Plan. Staff finds that this criterion has been met.

f) Adequate circulation and access shall be provided to serve all development pods/areas to be developed.

See analysis for Institutional and Civic Master Plan. Staff finds that this criterion has been met.

g) Appropriate screening and buffering of adjacent property and uses shall be provided;

See analysis for Institutional and Civic Master Plan. Staff finds that this criterion has been met.

h) An appropriate range of density for the entire property or for each development pod/area to be developed;

This standard is not applicable for this application as the proposed amendment is not modifying density.

i) An appropriate set of “default” or minimum standards for the entire property or for each development pod/area to be developed.

Zones 2 and 3 are subject to standards of the C-1 zone district.

j) An appropriate phasing or development schedule for the entire property or for each development pod/area to be developed.

A preliminary development program and phasing schedule have been provided in both the Airport Master Plan Update and the Terminal Area Plan. Chapter G in the Airport Master Plan Update contains the development program with a project list broken into short-term (0 to 5 years) and long term (6 to 20 years) categories. Chapter H of the Airport Master Plan Update also provides a Financial Implementation Plan. Chapter H of the Terminal Area Plan contains an implementation plan broken into four phases.

Implementation of the Plan is dependent on future funding.

ANALYSIS—Right-of-Way Vacation
Pursuant to Section 21.02.100 of the Zoning and Development Code, the vacation of public right-of-way or easement shall conform to the following:

a. The Comprehensive Plan, Grand Valley Circulation Plan, and other adopted plans and policies of the City.

The proposed right-of-way vacation is addressed by the following Goal of the Comprehensive Plan.

Goal 11: Public facilities and services for our citizens will be a priority in planning for growth.

Vacation of this right-of-way will have no impact on public facilities or services provided to the general public and supports the Airport runway relocation and extension. Staff therefore finds this request conforms with this criterion.

b. No parcel shall be landlocked as a result of the vacation.

The request to vacate the right-of-way will not render any parcel landlocked. Therefore, staff finds the vacation request meets with this criterion.

c. Access to any parcel shall not be restricted to the point where access is unreasonable, economically prohibitive or reduces or devalues any property affected by the proposed vacation.

No access to any parcel will be restricted by the vacation of this right-of-way. Staff finds this criterion has been met.

d. There shall be no adverse impacts on the health, safety, and/or welfare of the general community and the quality of public facilities and services provided to any parcel of land shall not be reduced (e.g. police/fire protection and utility services).

The right-of-way to be vacated will be replaced with right-of-way for the new alignment for 27 ¼ Road. Staff finds there will be no adverse impacts to the community or service providers; therefore, this criterion has been met.

e. The provision of adequate public facilities and services shall not be inhibited to any property as required in Chapter 21.06 of the Grand Junction Municipal Code.

The newly aligned section of 27 ¼ Road will provide adequate public facilities and

services to this area. Staff has therefore found this request to conform with this criterion.

f. The proposal shall provide benefits to the City such as reduced maintenance requirements, improved traffic circulation, etc.

The newly aligned 27 ¼ Road will be built to current City standards, thereby reducing maintenance costs in the near-term and will provide the same opportunity for access to this part of the community. Staff finds this request conforms with this criterion.

STAFF RECOMMENDATION AND FINDINGS OF FACT
After reviewing the request for approval of an Institutional and Civic Master Plan for the Grand Junction Regional Airport, amendment to Ordinance 3679, Planned Development, and vacation of a portion of the 27 ¼ Road right-of-way adjacent to Airport property, (FMP-2018-405), the following findings of fact have been made:

1. The requested Institutional and Civic Master Plan meets the requirements of Section 21.02.190 (c) of the Grand Junction Zoning and Development Code.

2. The Outline Development Plan conforms with the requirements of Section 21.02.150 (b) (2) of the Grand Junction Zoning and Development Code and meets more than one of the rezoning criteria provided in Section 21.02.140 of the Grand Junction Zoning and Development Code.

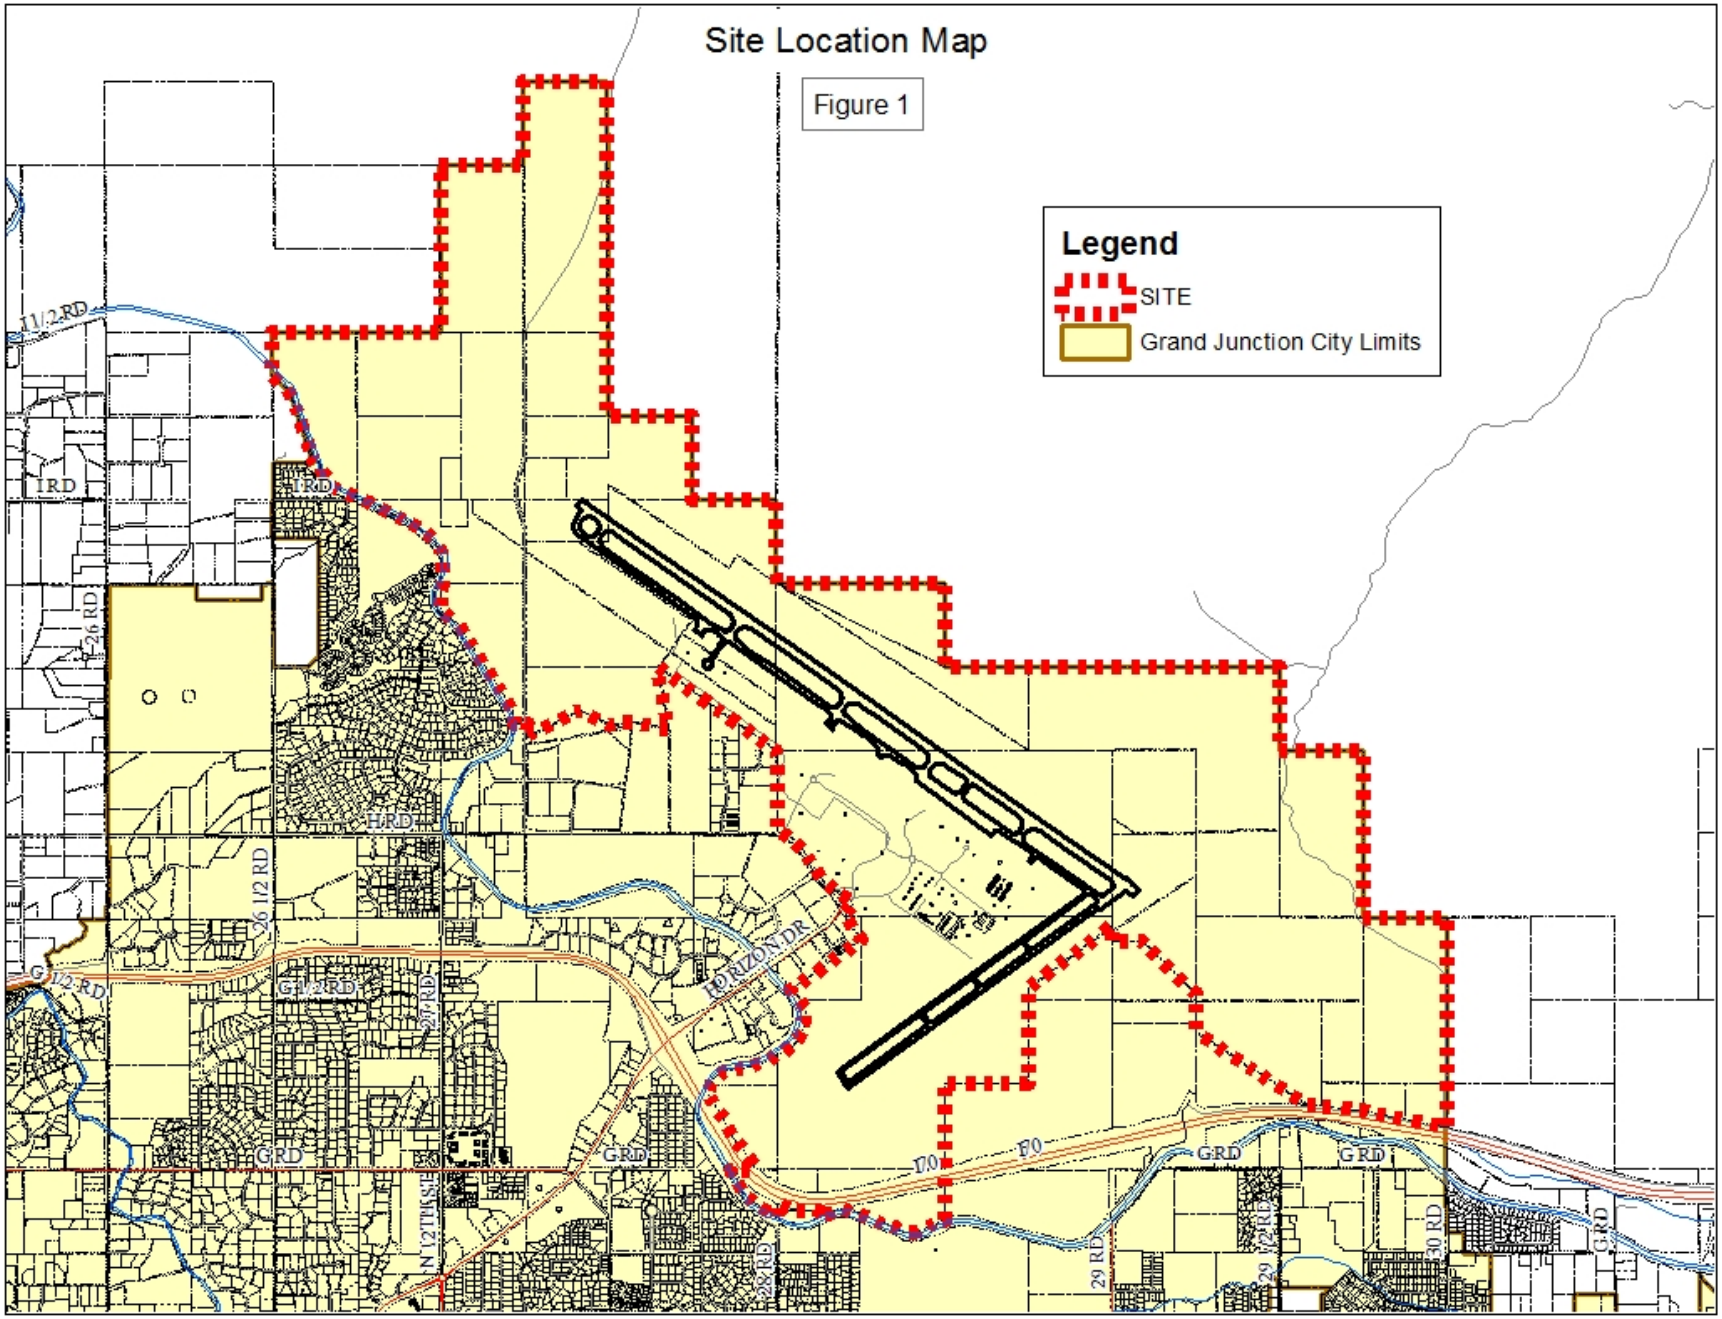
3. The request to vacate the 27 ¼ Road right-of-way conforms with the approval criteria of Section 21.02.100 (c) of the Grand Junction Zoning and Development Code. The proposed ordinance is conditioned on the acceptance of the realigned improvements, completion of the land patent transfer of property to the Airport and the dedication of right-of-way for the new alignment.

Therefore, Staff recommends approval.

FISCAL IMPACT:

This land use action does not have any direct fiscal impact.

SUGGESTED MOTION:



I move to introduce an ordinance approving the Grand Junction Regional Airport Institutional and Civic Master Plan and amending Ordinance No. 3679, Planned Development for the airport property and an ordinance vacating a portion of the 27 1/2 Road right-of-way adjacent to airport property and set a public hearing for March 6, 2019.

GENERAL PROJECT REPORT

Introduction

The Grand Junction Regional Airport Authority (GJRAA) updated the Airport Master Plan in early 2009. The GJRAA submitted the Master Plan Update to the City of Grand Junction for review pursuant to the Institutional and Civic Facility Master Plan provisions of the Grand Junction Municipal Code (§21.02.190) in September of 2010. After reviewing the Civic Master Plan application, the City Staff issued an Application Review Comments form requesting additional information from the GJRAA to satisfy various requirements of the Municipal Code. Shortly after receiving the staff comments and request for additional information, the GJRAA initiated a study to examine the existing passenger terminal facilities and look at alternatives for improvements to the terminal building and adjacent facilities. This study was among the recommendations of the Airport Master Plan Update. The GJRAA felt that a terminal area study might generate information pertinent to the issues raised by Staff in regard to the Airport Master Plan Update. As a result, the GJRAA requested an extension to the deadline for responding to the request for additional information in January 2011 in order to allow completion of the Terminal Area Plan. A second extension was obtained for this purpose in May 2011, since the Terminal Area Plan had still not been completed. With time running out, and no further extensions available, the GJRAA withdrew the pending Civic Master Plan application in August 2011 to allow the Airport Master Plan Update and Terminal Area Plan to be considered together. The airport administration felt it would be more productive and less confusing to combine the Airport Master Plan and Terminal Area Plan into a single application with the City.

In April of 2012 the GJRAA submitted a combined Institutional and Civic Facility Master Plan application to the City which included both the 2009 Airport Master Plan Update and the 2011 Terminal Area Plan. The application was reviewed by the Planning Commission in November of 2012 and received a recommendation of approval. However, before it could be reviewed by the Grand Junction City Council, the application was withdrawn due to the Airport contemplating further refinements to the planned improvements. Since that time, refinements were made to the drainage plans for the runway realignment project and the design for the realignment of 27 ¼ Road around the west end of the Airport has been completed. In addition, the Airport Administration Building, which was a recommended improvement in the 2009 Master Plan and 2011 Terminal Area Plan, was partially constructed before complications resulted in the funds for the project being returned to the Federal Aviation Administration (FAA). As a result, the building remains unfinished and its future use has yet to be finalized.

The most significant change since 2012 is that the GJRAA commissioned an amendment to the 2011 Terminal Area Plan in order to address a number of evolving conditions affecting the planned replacement of the Terminal Building. These conditions include changes to the

timing/schedule of both the Terminal Building replacement and the runway relocation project, shifting the implementation of both projects back several years or more. This shift required an analysis for extending the useful life of the Terminal Building as well as a reevaluation of phasing and capital improvement plans for the Airport. Despite delays in the implementation schedule, the Airport is proceeding with the design phase of the runway relocation project in order to be better prepared to act when funding is available. The Airport also has a number of other capital improvement projects in progress or scheduled in the near future. Given these conditions, the Airport recognized that the existing Terminal Building will likely need to remain for a longer period of time than was envisioned in the 2011 Terminal Area Plan. Consequently, the Airport prepared an amendment to the Terminal Area Plan, the focus of which was on making the existing Terminal Building safe, efficient and as functional as possible for the next several years, while minimizing investment in the building. The Terminal Area Plan Amendment was completed in October of 2017.

This application is requesting review of the Airport Master Plan Update and the Terminal Area Plan, as amended, pursuant to the requirements of §21.02.190 of Grand Junction Municipal Code. The 2009 Airport Master Plan Update, 2011 Terminal Area Plan and 2017 Terminal Area Plan Amendment have been provided in their entirety in the appendix of this application. The Airport Master Plan Update is included as Appendix A and the Terminal Area Plan is Appendix B. The Terminal Area Plan Amendment is Appendix C.

This application includes a description of the changes that have been made to the design for the 27 ¼ Road projects and drainage plans for the Runway Relocation project, as well as a discussion of the Administration Building, including a request for a change to the PD Zoning to accommodate greater flexibility for the uses that can be accommodated in the building. A revised Conceptual Drainage Report for the Runway Relocation project is included as Appendix H. A similar drainage analysis was provided in 2012, in response to a request from the City's Development Engineer. The current drainage report was completed in January 2108 and was updated to reflect changes to the drainage approach for the runway relocation project.

The changes to the drainage design for the Runaway Relocation project and the revisions to the 27 ¼ Road Realignment project did not require any revisions to the findings and recommendations contained in the attached Airport Master Plan Update. As a result, the version of this document included with this application is identical to the one provided in the 2012 application. Given that there have been significant changes to the recommendations related to the short-term improvements for the Terminal Building, a summary of new recommendations is provided in the Project Description section below. This application has also been revised to reflect changes to appropriate dates and to incorporate the public notice letter, mailing list and sign-in sheet from the Neighborhood Meeting which was conducted on the evening of May 3, 2018 in the 3rd floor conference room of the Airport Terminal building (Exhibits 11, 12 and 13).

In the following paragraphs, we have addressed the appropriate provisions of §21.02.190 of the Grand Junction Municipal Code as they relate to the Airport Master Plan Update and Terminal Area Plans as modified and described in this application. The structure of this portion of the application closely follows the City's "Report Checklist and Outline" for the general project report. Comments and additional information requested by the City Staff in connection with the original civic master plan application for the Airport Master Plan Update are also addressed. The amended Terminal Area Plan will be treated as a component of the overall Airport Master Plan for the purpose of addressing compliance with the applicable provisions of the Municipal Code in the application.

A | Project Description

Key Recommendations

For the purpose of the City's review of the Airport Master Plan Update and the Terminal Area Plan, it's important to identify the major recommendations contained in these documents and the projections upon which the recommended improvements are based. Chapter B of the Airport Master Plan Update addresses forecasting of future aviation activity, which will serve as the basis for the facility improvements necessary to meet estimated needs. Table B14 on page B.22 in the Airport Master Plan Update provides a summary of the aviation activity forecasts from 2007 to 2027. A key element of the forecasts is passenger enplanements. Passenger enplanements represents the number of passengers that board an aircraft and depart from the Airport, and is a number used to determine the future capacity of such facilities as the passenger terminal, public parking, rental car, and other facilities that serve commercial passengers. Table B14 shows that passenger enplanements are estimated to increase from 170,836 to approximately 371,423 over the 20-year planning period.

The following is a list of recommended improvements contained in the Airport Master Plan Update and the 2011 Terminal Area Plan. More detailed descriptions of the recommended improvements can be found in Chapter F of the Airport Master Plan Update and in Chapter E of the Terminal Area Plan. The recommendations contained in the 2011 Terminal Area Plan remain pertinent for the long-term future. The 2017 Terminal Area Plan Amendment provides recommendations and a revised implementation plan for the near-term improvements needed to main safe and efficient operation of the Terminal Building until funding is available for replacement of the Terminal Building as described in the 2011 Terminal Area Plan. The near-term improvements for the Terminal Building are described in Chapter C of the Terminal Area Plan Amendment. Chapter D contains the implementation strategy for achieving the near-term improvements. It's important to remember that the primary purpose of the Airport Master Plan Update is to reserve space for future airport facilities. The improvements listed below would be constructed on a phased basis in accordance with demonstrated need and available funds.

Key Improvements Recommended in the Airport Master Plan Update (see Figure F2)

- Relocate runway 11/29 and the associated taxiway system laterally 600 feet to the northeast and longitudinally 1,000 feet to northwest;
- Potential expansion of general aviation hangar facilities and related apron space;
- Potential new Air Traffic Control Tower;
- Relocate 27¼ Road around the west end of the new runway protection zone for the relocated runway 11/29;
- Continue to reserve space for a second parallel 11/29 runway (not expected to be constructed within the 20-year planning period).

Key Improvements Recommended in the Terminal Area Plan (see Figures E1, E3 & E4)

- Construct the Terminal Building Expansion, Phase I, located southeast of the existing terminal building.
- Construct Terminal Building Phase II (replace existing passenger terminal building) with a new facility also to the southeast of the existing terminal building;
- Potential construction of a 3-story parking structure just to the northwest of the existing passenger terminal building. The parking structure could contain up to 900 additional parking spaces;
- Improve unpaved overflow parking area to provide 160 additional surface parking spaces similar to the exiting pubic parking lot;
- Expansion of the de-ice pad to the southeast of the existing de-icing pad.

Key Improvements Recommended in the Terminal Area Plan Amendment

- Total redesign and replacement of the mechanical heating, ventilation, and air conditioning or HVAC system serving the main building entrance area and atrium;
- Identify and eliminate water penetration under the Terminal Building and consider other measures stabilize the structure;
- Install smoke evacuation system for the atrium, fire alarm upgrades and emergency and egress lighting;
- Roof repairs and replacement of the escalators in the main lobby;
- Consider installing passenger corridors leading to boarding bridges for both Gates 1 and 2 and a passenger boarding tunnel at Gate 1 to bridge the distance from the lower departure lounge to the aircraft.

The improvements described in the Terminal Area Plan Amendment, and the analysis that supports them, are described on pages 33 through 39. The recommended passenger corridors and board tunnel are also depicted on Figure 11 in the Terminal Area Plan Amendment. Figure 13 in the Terminal Area Plan Amendment is a Revised Conceptual Development Plan for the terminal area and it shows improvements divided into four phases. The improvements identified in the Terminal Area Plan Amendment, and listed above, represent Phase I. The other

three phases reflect the long-term improvements described in the 2011 Terminal Area Plan. It should be noted that the Terminal Area Plan Amendment shows the partially-constructed Admin Building and being demolished. As discussed below, the current thinking regarding this building is to seek one or more private entity partners to reconfigure and complete the building and as opposed to pursuing demolition.

The 2011 Terminal Area Plan also includes a discussion of potential non-aviation development which begins on page E.12 of the document. There are three potential development areas that fill the vacant land between the existing on-airport road system, the public parking lot, and H Road. Figure E4 is an illustrative site plan, which is intended to provide an example of how these areas could be developed for a variety of commercial and commercial/industrial facilities. Development of these areas would be subject to the requirements of the City's C-1 zone district pursuant to Ordinance No. 3679, since they are shown as being located mostly within the "non-aeronautical" area on the map that accompanies Ordinance No. 3679. All of the other improvements recommended in the Airport Master Plan Update, Terminal Area Plan and Terminal Area Plan Amendment are located within the areas shown as "Aeronautical" and "Aeronautical/Commercial" on the map attached to the Ordinance. As a result, these improvements would be governed by the standards and requirements contained in Ordinance No. 3679, a copy of which is included as Exhibit 1 of this application.

As mentioned previously, the partially constructed Admin Building is currently located within the Aeronautical zone. In its current state, the Admin Building is consuming valuable space, degrading the visual character of the terminal area and creating liability issues for the Airport. The GJRAA is currently exploring solutions to complete the building and put it to beneficial use. The building was originally configured to be used entirely for Airport purposes. However, after careful evaluation, the Airport has determined that they no longer need the entire building and are considering seeking a private entity with which to partner to reconfigure the building for a mix of uses. The Airport is considering uses such as restaurant and office among the potential cotenants of the building. Since neither the Aeronautical nor the Aeronautical/Commercial zone permit commercial office uses, the GJRAA is proposing the expand the Non-aeronautical/Commercial zone to include the Admin Building. The proposed reconfiguration of the Non-aeronautical Commercial zone is depicted on the Proposed PD Districts Map (Exhibit 14). The proposed configuration incorporates the Admin Building and the area around it, which was intended for parking and vehicle circulation, as well as the entry area north of Aviator's Way that includes the historic military aircraft display. Exhibit 17 is a concept sketch showing the layout that was intended for the Admin Building before it was abandoned.

The Non-aeronautic/Commercial zone also permits other uses allowed in the C-1 zone district. While some of these uses might not be appropriate for the Admin Building, the GJRAA is the landowner and has control over the uses that would ultimately be allowed. In addition, concurrence from the Federal Aviation Administration (FAA) is required for any proposed uses

within the building. The City also retains the ability to review any proposed uses since all projects within the Non-aeronautical/Commercial zone require review and approval by the Grand Junction Planning Commission pursuant to Ordinance No. 3679. These overlapping jurisdictional controls should ensure that the future use of the building is consistent with both Airport and Community interests.

Location

The subject property is the Grand Junction Regional Airport, the location of which is approximately 3.5 mile northeast of downtown Grand Junction. Figures A1 and A2 in the Airport Master Plan Update (Appendix A) show the airport's location within the region and in relation to the City of Grand Junction. Figure A3 in the enclosed Terminal Area Plan (Appendix B) shows the area which is the focus of the Terminal Area Plan. The study generally surrounds the existing terminal building and main parking lot, and incorporates much of the undeveloped land surrounding the terminal parking lot.

Acreage

The Grand Junction Airport contains 2,357 acres. Detailed information regarding the existing conditions and facilities at the Airport are provided in Chapter A of the Airport Master Plan Update document. The airport's terminal area, as defined in the Terminal Area Plan, encompasses approximately 120 acres. Chapter A of the Terminal Area Plan includes background information and an inventory of existing facilities and uses.

Proposed Use

The airport is a complicated facility that contains a variety of uses in support of the airport's primary purpose of providing public and private aviation services. The Airport Master Plan Update document includes a description of the existing facilities and uses at the Airport, as well as description of the recommended use of all lands within the airport property and its' vicinity. This discussion begins on page F.26 in Appendix A and encompasses Figures F19 through F23. Figures F19, F20 and F21 focus on the terminal area, while Figure F22 provides a graphic depiction of both off-airport and on-airport uses. This figure also shows several of the key airport protection zones including the Runway Protection Zone and the Noise Zone which represents the area within the projected 65 DNL noise contour. Figure F22 provides thorough understanding of the airport's relationship to the surrounding neighborhoods. Figure F23 is the Airport Property Map. This document provides detailed information regarding the various parcels that make up the airport property including the size of the parcel, when it was acquired, and the Federal grant via which the property was acquired. Note that these exhibits were prepared prior to the construction of the Administration Building.

One of the key changes planned for the Airport is the relocation of the existing primary runway (Runway 11/29) and the related taxiway system. This runway will be moved to an alignment that

parallels the existing runway, but will be shifted approximately 600 feet to the northeast and laterally approximately 1,000 feet to the northwest. The existing runway will then be used as the parallel taxiway. This relocation is recommended in order to correct non-standard conditions associated with the existing runway and its connecting taxiways. The drawings listed in the previous paragraph reflect the necessary improvements associated with the relocated runway and taxiways.

The Terminal Area Plan Amendment includes a summary of the revised development concept for redevelopment of the Grand Junction Regional Airport's "terminal area." This summary occurs on Page 44 and is depicted in Figure 13 of the Terminal Area Plan Amendment. The phasing depicted on Figure 13 supersedes the phasing discussion contained in Chapter E of the 2011 Terminal Area Plan. Basically, the recommended improvements described in the Chapter E of the 2011 Terminal Area Plan remain the same, with the exception of those related to the Admin Building, but the phasing has been revised to address the need to keep the existing Terminal Building operational until construction of the replacement terminal becomes financially feasible. The revised phasing also necessitated revisions to the financial implementation plan for the terminal area improvements. Terminal Area Plan Amendment includes a revised Implementation Plan (Section D), which substitutes for the implementation plan found in Chapter H of the original Terminal Area Plan.

Although replacement of the Terminal Building has been pushed back some progress has been on the design of the building. Subsequent to the completion of the 2011 Terminal Area Plan, preliminary architectural design and associated renderings where completed for the replacement terminal. The Terminal Area Plan Amendment report includes a rendering of the resulting terminal design (Figure 2). While this is a conceptual drawing, it does provide a sense of the aesthetic direction being contemplated for the replacement terminal.

The Admin Building has been partially constructed since the Terminal Area Plan was completed and the current location and configuration of the building is depicted on Exhibit 5 of the 2017 Terminal Area Plan Amendment. This exhibit also shows the access drive and parking facilities that were planned for the Admin Building at the time it was constructed. As noted in the project description section of this application, the Airport is seeking to partner with one or more private entities to renovate the building to accommodate a mix of uses. The exact use mix has not yet been determined.

B | Public Benefit

The Grand Junction Regional Airport is a public facility that provides commercial passenger service, along with general aviation facilities, air cargo, and a small amount of military activity. The Airport, along with the aviation-related businesses and facilities, represents a vital and significant regional economic asset. In addition to the many aviation-related assets, the Airport

also provides benefits to the local businesses and industries, promotes tourism, and encourages additional business development and expansion throughout Grand Junction, Mesa County, and the surrounding region. The 2013 Colorado Airports Economic Impact Study quantified the total impact of the Grand Junction Regional Airport at 2,871 jobs, with a total payroll of $130,775,972 and a total economic output of $380,039,796.

One of the GJRAA's main objectives in developing the Airport Master Plan Update and Terminal Area Plan was to accommodate aircraft operations and the travelling public with great reliability and safety, and to make the most efficient use of the available land for aviation related activities and supporting uses. Both the Master Plan Update and the Terminal Area Plan, as amended, were developed to define improvements at the Airport that will enable it to accommodate the future needs and requirements of the City of Grand Junction, Mesa County and the larger surrounding service area. The process of developing the Airport Master Plan Update included gathering community input to establish a set of assumptions to guide the airport planning process. The assumptions include ensuring that the Airport is developed in a manner consistent with local ordinances and codes, as well as federal and state statutes, federal grant assurances and Federal Aviation Administration (FAA) regulations. The purpose of the Airport Master Plan Update and Terminal Area Plan is to ensure that the Airport can continue to benefit the public in a manner consistent with the community's vision for the future as well as applicable laws, policies and regulations.

C | Neighborhood Meeting

A neighborhood meeting was conducted at 6 p.m. on October 17, 2011 to share information related to the findings and development recommendations contained in both the Airport Master Plan Update and the Terminal Area Plan. The meeting included discussion of the potential replacement of the terminal building and relocation of the primary runway (Runway 11/29). The meeting was held at the Marriot Residence Inn at 767 Horizon Drive in Grand Junction. All attendees had the opportunity to ask questions and submit comments. Following the Neighborhood meeting, the Airport accepted comments for a period of 15 days beginning on October 17 and ending on October 31, 2011. A copy of the approved notice for the meeting was mailed to every property owner and known group within 1,000 feet of the exterior property boundary of the Airport. Copies of the notice and the mailing list used for noticing purposes are included as Exhibits 2 and 3.

An additional Neighborhood Meeting was conducted at 5:50 p.m. on May 3, 2018 in the 3rd Floor Conference Room of the Airport Passenger Terminal. Copies of the notice and mailing list for this meeting are include as Exhibits 11 and 12. Attendees had an opportunity to ask questions and submit comments. Following the meeting, the Airport accepted comments for a period of seven days beginning on May 3 and ending on May 10, 2018.

During both meetings, representatives of GJRAA presented plans and information regarding the recommended improvements contained in the Airport Master Plan and the Terminal Area Plan, as amended, and answered questions from members of the public. The 2011 neighborhood meeting had 26 attendees from the public; seven written comments were received within the comment period. Copies of the written comments from the 2011 meeting are included in Exhibit 4 of this application. Only eight members of the public attend the meeting on May 3, 2018 and no written comments were received either during the meeting or during the seven-day comment period. A copy of the sign-in sheet from the meeting is provided as Exhibit 13.

D | Project Compliance, Compatibility and Impact

1. Conformance with the Comprehensive Plan

Response: Conformance with the applicable comprehensive plans and policies is addressed in the response to item 12, below. Conformance with the Grand Junction Comprehensive Plan (2009) and the Grand Valley Circulation Plan are among the review criteria required for approval of an Institutional and Civic Facility Master Plan under section 21.02.190 of the Grand Junction Municipal Code.

2. Land Use in the Surrounding Area

Response: An inventory of the land use and zoning in the areas surrounding the Airport can be found beginning on page A.15 in the Airport Master Plan Update document. Figure A5 in the Airport Master Plan Update is a map showing the existing zoning surrounding the Airport. The Grand Junction Regional Airport is well located in terms of limiting impacts on surrounding land uses. Areas to the north and east of the Airport are owned by the BLM and are used primarily for recreation activities including motorized vehicle recreation. There are residential neighborhoods to the west of the airport property and to the south of I-70. The entrance to the Airport is comprised of business and commercial uses on both sides of Horizon Drive from I-70 to the airport property. To the east of the Airport is an area of vacant land associated with Indian Wash. Beyond Indian Wash is vacant land which is part of a planned development owned by Horizon View Holdings, LLC.

3. Site Access and Traffic Patterns

Response: Vehicular access and parking for the Airport are described on pages A.9 and A.10 in the Airport Master Plan Update document (Appendix A). Access to the Airport utilizes Horizon Drive and H Road. Figure A3 in Appendix A shows the existing airport layout and how the internal road system connects to Horizon Drive and H Road. No significant changes are contemplated to the airport's internal road system in association with either the overall Airport Master Plan Update or the Terminal Area Plan.

Since the Airport Master Plan was completed, design work on the 27 ¼ Road realignment project has been completed and the project is currently out to bid. The current alignment for 27 ¼ Road around the west end of the Airport is depicted on Exhibit 18. Current conceptual plans for the Airport show an extension of Landing View Lane to the west connecting to the realigned 27 ¼ Road, as shown on Exhibit 18.

4. Availability of Utilities

Response: An infrastructure inventory and assessment, and an assessment of future system potentials, was prepared as part of the Airport Master Plan Update. This inventory includes the major components of water, sanitary sewer, electrical, natural gas, and telecommunication systems on the Airport and in the vicinity of the Airport. The complete Master Utility Report is included as Appendix Two of the Airport Master Plan Update. All major utilities are available at the Airport. The Airport currently has existing service for all major utilities. Water service is provided by the Ute Water Conservancy District. Sanitary sewer service is provided by the City of Grand Junction and the Airport is located within the 201 Sewer District. Century Link provides the Airport's telecommunications service.

5. Special or Unusual Demands on Utilities

Response: While the Airport is a large industrial facility, it does not place many special or unusual demands on utilities. Perhaps the most unusual demand is the amount stormwater runoff from the large paved surfaces and the handling of aircraft fuel, de-icing fluid, and other chemicals required for the normal operation of aircraft. The State of Colorado classifies the Grand Junction Regional Airport as a heavy industrial site based upon the volume of fuel sales and the use of de-icing agent. As a result, the Airport is required to obtain a discharge permit under the Colorado Discharge Permit System (CDPS). The CDPS requires the preparation and maintenance of a stormwater management plan (SWMP). The SWMP for the Grand Junction Regional Airport includes numerous provisions to monitor and control the use of chemicals and to minimize the potential for pollutants to be carried offsite via stormwater runoff. A copy of the airport's current SWMP, which addresses this issue in detail, is included as Appendix D. The Airport is currently planning to update the SWMP for the proposed Runway Relocation project. The revised SWMP will be completed as the Runway Relocation project proceeds to the construction planning phase. A copy of the SWMP will be provided to the City as part of the permitting for the runway relocation project.

De-icing activity at the Airport is limited to aircraft only; there is no de-icing of runway or taxiway surfaces. All de-icing of commercial aircraft takes place at the dedicated de-icing facility. Generally, the system is activated during de-icing events in order to capture and recover glycol mixes. Therefore, the majority of glycol contaminated storm water is captured at the time of the de-icing event. The Airport contracts with Goodwin S/T Service to pump the de-icing fluid recovery tank and transport it to a facility for handling. To a much more limited extent, de-

icing occurs on the general aviation ramp by small aircraft operators. At these times, glycol is applied to the aircraft wings. Glycol usage during small aircraft de-icing is on the order of one gallon and does not occur frequently. For these reasons, and the fact that the Airport has been proactive by designing and implementing a glycol recovery system, storm water contamination by aircraft de-icing activities is not a significant risk.

6. Effects on Public Facilities

Response: Public facilities are addressed in the response to item 12, below, which covers compliance with the review criteria for Section 21.02.190 of the Grand Junction Municipal Code.

7. Site Soils and Geology

Response: The Master Drainage Report prepared by Jviation includes NRCS web soil survey data for much of the airport property (see Appendix One of the Airport Master Plan – Appendix A). An additional NRCS web soil survey has been provided which provides basic soils information for the entire airport property (see Exhibit 5). Furthermore, the Airport completed an Environmental Assessment for the runway relocation and commissioned a geotechnical report as part of that project. A copy of the Preliminary Geotechnical Subsurface Exploration Program (Geotechnical Report), prepared by Ground Engineering Consultants, Inc., is included as Appendix E. The focus of the geotechnical analysis is limited to the area that encompasses the existing and proposed 11/29 runways. However, similar subsurface exploration and geotechnical reports have been prepared for other projects on the airport property, including the Rental Car Services Facility (2009), Commercial Ramp Reconstruction (2009), and the ARFF/SRE Pier Evaluation (2010). The study area was evaluated for a variety of geologic hazards, but seems to be prone to only two such hazards; expansive soils, and low to moderate collapsible soils.

8. Impacts of Project on Site Geology and Geologic Hazards

Response: The Geotechnical Report (Appendix E), provides a section which discusses the potential impacts associated with the runway relocation. Most of the other improvements described in the Airport Master Plan Update and Terminal Area Plans are located in areas that are already developed and no additional impacts related to site geology are anticipated in these areas.

9. Hours of Operation

Response: The Airport is open 24 hours per day. The Air Traffic Control Tower is open from 6 a.m. to 10 p.m. The passenger terminal opens an hour before the first commercial flight departs in the morning and closes an hour after the last flight arrives in the evening.

10. Number of Employees

Response: The Airport conducted a survey of all employees who work on the airport property as part of the 2008 Colorado Airports Economic Impact Study. The results of the survey are provided in Exhibit 6. While this data is 10 years old, it's the most recent airport-wide information available. A summary of total employees is provided below:

Employee Count (Airport Property)

- Full-time Employees: 611
- Part-time Employees: 197
- Total Employees: 808

11. Signage Plans

The Airport Master Plan Update and Terminal Area Plans do not include any recommendations for changes or additions to existing signage at the Airport. However, when the Admin Building is completed, some additional wayfinding signage may be needed to direct people to this facility, depending on how the building is ultimately used. Signage is addressed in Ordinance No. 3679, which requires compliance with the City of Grand Junction Municipal Code.

12. Review Criteria - §21.02.190(C)(1 through 5)

The Grand Junction Regional Airport is a major civic facility and subject to review pursuant to the provisions of Section 21.02.190 of the Grand Junction Municipal Code, which specifies the review process and criteria for institutional and civic facility master plans. There are five criteria that must be considered in the review of such master plans. Conformance with these criteria is addressed in the following paragraphs.

(a) Conformance with the Comprehensive Plan and other area, corridor or neighborhood plans**.**

Response: The Grand Junction Comprehensive Plan of 2009 (Comp Plan) was adopted February 2010 and is the applicable comprehensive plan for the Grand Junction Regional Airport. It's worth pointing out that the Airport Master Plan Update had already been completed when the Comp Plan was adopted. As a result, the policies in the Comp Plan contemplate expansion of airport facilities and, in one instance, even reference the Airport Master Plan Update document. The growth projections contained in the Comp Plan indicate that growth in the area has been occurring at an annual rate of approximately 2.6% over the past 36 years. The Comp Plan also states that population is expected to double by the year 2035. This growth data is generally consistent with the information used for the forecasting contained in Chapter B of both the Airport Master Plan and the Terminal Area Plans. The contemplated improvements in the Airport Master Plan and Terminal Area Plans are designed to accommodate the level of growth anticipated in the Comp Plan. The Airport is

located within the Urban Development Boundary (UDB), which is the area designated in the Comp Plan as intended for "urban intensity development."

The Comp Plan breaks the City into a number of geographic areas referred to as "planning areas." The airport is located within the Horizon Planning Area. The area to the west is referred to as the Appleton Planning Area, while the Garfield Planning Area is to the east of the Airport. The Garfield Planning Area was relatively new when the Comp Plan was prepared and has been identified for long-term development of industrial and commercial land uses, particularly along the I-70 corridor. At present, much of the Garfield Planning Area is vacant land. The Appleton Planning Area is an established and developing area, comprised predominantly of low-density residential uses.

The Future Land Use Map in the Comp Plan designates a large area that includes the Airport and some additional surrounding lands as "Airport." This designation is identified as appropriate for Planned Airport Development (PAD) zoning. This is the district within which the Airport is located and which was created via Ordinance No. 3679.

There are several policies in the Comp Plan that provide guidance regarding recommended improvements in the Airport Master Plan Update and the Terminal Area Plan. These policies are addressed in the following paragraphs. The text in bold italics represents excerpts from the Comp Plan.

> ***Goal 7:* New development adjacent to existing development (of a different density/unit type/land use type) should transition itself by incorporating appropriate buffering.**
>
> ***Policy:***
> ***A. In making land use and development decisions, the City and County will balance the needs of the community.***
>
> **Conformance:** The Grand Junction Regional Airport is located at the north edge of the City. Much of the surrounding land is owned and managed by the Bureau of Land Management (BLM). In addition, the airport property contains 2,357 acres and the runway system has been oriented to minimize over-flight of residential areas and other sensitive uses as much as possible. Even with these factors, the Airport recognizes the need to remain constantly vigilant in efforts to minimize the impacts of aircraft operations and other activities on the community. The airport property includes vacant land in the area southwest of the primary commercial runway (11/29). This land currently serves as somewhat of a buffer for residents in the Grand Vista, Garfield Estates, Summer Hill and Paradise Hills neighborhoods. The recommended runway relocation will move runway 11/29 600 feet further from these neighborhoods.

***Goal 8:* Create attractive public spaces and enhance the visual appeal of the community through quality development.**

Policies:
A. Design streets and walkways as attractive public spaces.

Conformance: In 2007, the Airport made significant improvements to the internal street system and parking areas. The improvements contemplated in the Airport Master Plan Update and Terminal Area Plans would continue to enhance the aesthetic appeal of the Airport. The Terminal Area Plans recommend that future parking improvements be similar in character to the existing public parking lot. The potential redevelopment of the Main Terminal Building represents an exciting opportunity to update the visual and functional character of the Airport.

Shortly after the Airport Master Plan Update was completed, the GJRAA commissioned the preparation of a set of design guidelines to ensure quality development at the Airport. A copy of the Design Intent Guidelines is included as Appendix F. The Design Intent Guidelines include a list of goals to be achieved in the development of the future improvements at the Airport. The goals are listed as follows:

- *Reinforce a positive and memorable experience for visitors;*
- *Convey an image of quality development for the Airport, its passengers, visitors, tenants, and the community;*
- *Maintain a consistent campus appearance through complimentary design of site, signage, landscape, and building development;*
- *Allow and encourage development with creative and compatible design solutions;*
- *Encourage a "regional contemporary" architectural style;*
- *Provide for development and construction which allows for minimal impact to airport operations.*

***Goal 9:* Develop a well-balanced transportation system that supports automobile, local transit, pedestrian, bicycle, air, and freight movement while protecting air, water and natural resources.**

Conformance: The Airport is recognized as a vital component of the transportation system and a valuable asset to the City of Grand Junction and surrounding region. The improvements contemplated in the Airport Master Plan and Terminal Area Plan, as amended, will allow the Airport to continue to meet the community's air transportation and air freight needs. The recommended improvements have been evaluated for impacts to a wide range of environmental factors and the results of this analysis are provided in Chapters E in the Airport Master Plan Update and F in the 2011 Terminal Area Plan. The changes to the improvements described in the 2017 Terminal Area Plan Amendment do not significantly alter the findings contained in Chapter F of the original Terminal Area Plan. Some of the recommended improvements, such as the runway

relocation, will also be subject to further environmental review in accordance with NEPA regulations.

Goal 12: ***Being a regional provider of goods and services the City and County will sustain, develop and enhance a healthy, diverse economy.***

Conformance: The Grand Junction Regional Airport provides national airline passenger and air freight service to the City of Grand Junction, Mesa County, and the surrounding region. The annual economic benefits of the Airport on the local and regional economy were estimated at nearly $400,000,000 in the 2013 Colorado Airports Economic Impact Study.

(b) Conformance with the Grand Valley Circulation Plan and general transportation planning requirements.

Response: Conformance with the Grand Valley Circulation Plan (GVCP) is addressed on page A.20 and in Figure A8 in the 2011 Terminal Area Plan. The primary issue is that the GVCP shows 29 Road running through the Airport and connecting to H Road and Horizon Drive at the airport entrance roundabout. The use of airport land for non-aeronautical purposes presents some issues related to limitations associated with federal grant funds that were used to purchase the airport property. As a result, the Airport Layout Plan, which is a drawing in the Airport Master Plan Update that requires FAA approval, does not show the 29 Road alignment through the Airport. This issue was raised as part of the staff comments when the Airport Master Plan Update was originally submitted for review in 2010. Since that time, representatives of the Airport met with members of the City of Grand Junction and Mesa County staff to discuss the process for evaluating alignment alternatives for the extension of 29 Road. As a result of those meetings, Rick Doris, City of Grand Junction Development Engineer, sent a letter to Rex Tippets, then Director of Aviation for the Airport, outlining the process for evaluating a new interchange between 29 Road and Interstate 70. The letter indicates that the H Road to 29 Road connection would be evaluated at the same time, using a similar process. At that time the Airport agreed to participate in the study for the extension of 29 Road. A copy of the 2011 letter from Mr. Dorris is included as Exhibit 7.

The City continues to work with the Airport to evaluate other alignments for the extension of 29 Road. The current thinking is to run 29 Road around the south end of the general aviation runway (Runway 4/22). The Airport continues to be willing to participate in the planning studies for the 29 Road extension. However, any alignment through Airport property will also require approval form the FAA.

(c) Adequate parking, adequate stormwater and drainage improvements, minimization of water, air or noise pollution, limited nighttime lighting and adequate screening and buffering potential.

Response: Responses for each of the subject areas is provided below.

Parking: Existing parking and forecast parking needs are addressed in Chapters C and D of the 2011 Terminal Area Plan. The analysis shows the need for additional parking spaces to handle the forecast increase in enplanements. The refined development concept in Chapter D includes recommendations to improve the unpaved overflow public parking lot and develop a parking structure to provide the additional parking spaces. These improvements would be phased based on need and funding availability. No changes to the forecast parking need or the recommendations to improve the unpaved overflow parking lot or develop a parking structure were identified in the 2017 Terminal Area Plan Amendment.

Stormwater and drainage improvements: The Airport Master Plan Update includes a Master Drainage Report that was prepared in May 2009 (see Airport Master Plan Appendix). This report was updated in 2012. A copy of the revised report is included as Appendix G. In addition to providing more current and detailed drainage design than the 2009 report, the revised drainage report addresses several questions that were raised by the City staff during the original review of the Airport Master Plan Update. Also included with this application is the Conceptual Drainage Report for the Runway 11/29 Relocation Program (Appendix H). This report focuses more on the drainage design for the runway relocation project while the Master Drainage Report addresses hydrology and drainage for the ultimate build-out of the Airport.

Minimization of water, air or noise pollution: These and other environmental issues are addressed in Chapter E of the Airport Master Plan Update and Chapter F of the 2011 Terminal Area Plan.

Lighting, screening and buffering: Light emissions and visual impacts are addressed in Chapter E of the Airport Master Plan Update and Chapter F of the 2011 Terminal Area Plan.

(d) Adequacy of public facilities and services.

Response: Adequacy of existing utilities is addressed in the Master Utility Report which is included in the appendix of the Airport Master Plan Update document. Other community services such as police and firefighting are not directly addressed in the Airport Master Plan since the Airport Master Plan is only intended to reserve space at the Airport for needed facilities. With respect to fire, the Airport is equipped to handle the firefighting needs within the airport property. Emergency medical service needs are handled by outside providers. The need for these services is infrequent and is not expected to increase significantly if the proposed improvements are constructed over the 20-year planning period. Similarly, the Airport provides its own security services for both the airside and landside facilities.

Should the commercial buildings in the area surrounding the public parking lot be developed (see Chapter E of the Terminal Area Plan), they would be subject to further land

use review under the applicable provisions of the Grand Junction Municipal Code. Issues related to the adequacy of public facilities and services would be addressed at that time.

(e) Community benefits from the proposal.

Response: This criterion is addressed in the Public Benefit section of this report.

E | Development Schedule and Phasing

A preliminary development program and phasing schedule have been provided in both the Airport Master Plan Update and the Terminal Area Plan. Chapter G in the Airport Master Plan Update contains the development program with a project list that includes estimated costs. These costs are intended for planning purposes. This list is broken into short-term (0 to 5 years) and long-term (6 to 20 years) categories. Chapter H of the Airport Master Plan Update also provides a Financial Implementation Plan.

The Terminal Area Plan also contains an implementation plan with cost estimates and a phasing schedule for the terminal area improvements (see Chapter H). The potential improvements necessary to accommodate the future terminal area needs of Grand Junction Regional Airport have been placed into four phases. These four phases are shown on Figure E1 in Chapter E of the Airport Terminal Area Plan. The phasing schedule and financial implementation plan for the recommended terminal area improvements were revised in the 2017 Terminal Area Plan Amendment and are contained in Sections C and D of Appendix C.

F | Relationship to City Planning Process

Development at the Grand Junction Regional Airport is primarily governed by Ordinance No. 3679, which includes a map dividing the Airport into three zones; 1) Aeronautical, 2) Aeronautical/Commercial, and 3) Non-aeronautical. These zones are depicted on a map attached to the ordinance, which is included as Exhibit 1 to this application. Development within Zones 1 and 2 is governed by the standards in Ordinance No. 3679. It's the Airport's understanding that compliance with these standards would be addressed during the building permit process or other required permits for projects not involving structures, for each project and that no further planning reviews would be required. However, development within Zone 3 is subject to all requirements of the City's C-1 (Light Commercial) zone district and would be subject to the applicable review process in the Grand Junction Municipal Code. According to Ordinance No. 3679, all development in Zone 3 would require review and approval by the Planning Commission prior to the building permit review process. All of the improvements recommended in the Airport Master Plan Update are located in Zones 1 and 2. The only development discussed in the Terminal Area Plan that would be located within Zone 3 is the potential commercial and commercial/industrial buildings shown surrounding the public parking lot in Figure E3 of the 2011 Terminal Area Plan.

As mentioned previously, the Airport is proposing to expand Zone 3 to incorporate the Admin Building and the surrounding land planned for parking and vehicular circulation. More information related to this proposal can be found in the Project Description section of this application. The Airport understands that any redevelopment of the Admin Building would be subject to the requirements of the C-1 zone district and would require review and approval by the Grand Junction Planning Commission.

Inventory

A. Inventory of Existing Conditions

MASTER PLAN UPDATE

GRAND JUNCTION

REGIONAL AIRPORT

A. Inventory of Existing Conditions

The City of Grand Junction, with a picturesque backdrop of mountains and monuments in Western Colorado, offers year-round amenities to both visitors and local residents. Grand Junction Regional Airport is located approximately 3.5 miles northeast of downtown Grand Junction. The Airport provides a safe operating environment for all classes of aircraft, including small general aviation aircraft, corporate business jets, and commercial service passenger aircraft. The airport's relative location within the region is illustrated in the following figure, AIRPORT LOCATION MAP.

The Airport, along with the aviation-related businesses and facilities, represents a vital and significant regional economic asset. In addition to the many aviation-related assets, the Airport also provides benefits to local businesses and industries, promotes tourism, as well as encourages additional business development and expansion throughout Mesa County, the surrounding communities, and adjacent counties. The 2008 Colorado Airports Economic Impact Study quantified the total impact of the Grand Junction Regional Airport at 6,125 jobs with a total payroll of $189,204,000 and a total economic output of $623,693,600.

The last Airport Master Plan for Grand Junction Regional Airport was completed in 1997. The Airport Layout Plan has been kept current since 1997 with significant updates in 2002 and 2007. During the years since completion of the 1997 Master Plan, changes have transpired within the aviation industry on a local, regional, and national level that impact the aviation facilities and services provided at the Airport. These changes necessitate a re-evaluation of the Airport's Master Plan as a means of analyzing current and forecast operational characteristics and facilities, as well as updating the program for airport development. The population growth and economic expansion that is occurring within the region have necessitated a long-range analysis and plan for the future needs of the Airport to accommodate aviation demand.

The focus of this document will be on the total aviation facility and its environs, with the overall planning goal being the development of an aviation facility that can accommodate future demand and that is not significantly constrained by its environs. This initial *Inventory of Existing Conditions* chapter examines three basic elements involved with the existing and future development of Grand Junction Regional Airport. These elements are: the airport facilities (runways, taxiways, aircraft parking aprons, hangars, maintenance facilities, ground access, etc.);

the relationship to the airport/airspace system; and, the airport environs. Subsequent chapters detail the Airport's forecasts of aviation activity, the ability of airport facilities to safely and efficiently meet the needs associated with the projected aviation activity, the compatibility of the Airport with surrounding land uses, and recommended future development within and around airport property.

As illustrated in the following figures, *AIRPORT LOCATION MAP* and *AIRPORT VICINITY MAP*, the City of Grand Junction, with a population of approximately 46,898, is the county seat for Mesa County, which has a population of 134,189. Grand Junction is perhaps best known for its proximity to year-round outdoor recreation areas, such as ski resorts, hiking trails, fishing, golf courses, horseback riding trails, mountain bike trails, camping facilities, etc. However, other nearby attractions include: the Colorado National Monument, the McInnis Canyons National Conservation Area, the Grand Mesa National Forest and the Uncompahgre National Forest, as well as many local vineyards and wineries in what is known as Colorado Wine Country.

Airport Role

Grand Junction Regional Airport is owned and operated by the Grand Junction Regional Airport Authority Board. The Board is comprised of seven appointed members; three from Mesa County, three from the City of Grand Junction, and one at-large member. The majority of the land owned by the Grand Junction Regional Airport Authority was purchased/deeded from the City of Grand Junction and Mesa County. The Airport Manager is responsible for the day-to-day operation of the Airport and reports to the Board.

The Airport encompasses 2,357 acres and is 4,858 feet above mean sea level. The Federal Aviation Administration (FAA) categorizes the Airport as a non-hub, commercial service airport (FAA Site number 02624). The Airport Reference Point (ARP) is Latitude 39° 07' 20.6850"N and Longitude 108° 31' 36.2450"W. The mean, maximum temperature of the hottest month (July) at the Airport is 97.7 degrees Fahrenheit.

Currently, the Airport is served by five airlines on a yearly basis, SkyWest Airlines/United Express with daily service to Denver; SkyWest Airlines/Delta Connection with daily service to Salt Lake City; Great Lakes Aviation with daily service to Denver; US Airways with daily service to Phoenix; and Allegiant Air with service to Las Vegas. New air carrier service started in Spring 2008 from American Airlines/American Eagle with daily service to Dallas, and Frontier Airlines/Lynx Aviation with daily service to Denver. Great Lakes Aviation also announced that it ceased service to Grand Junction in 2008.

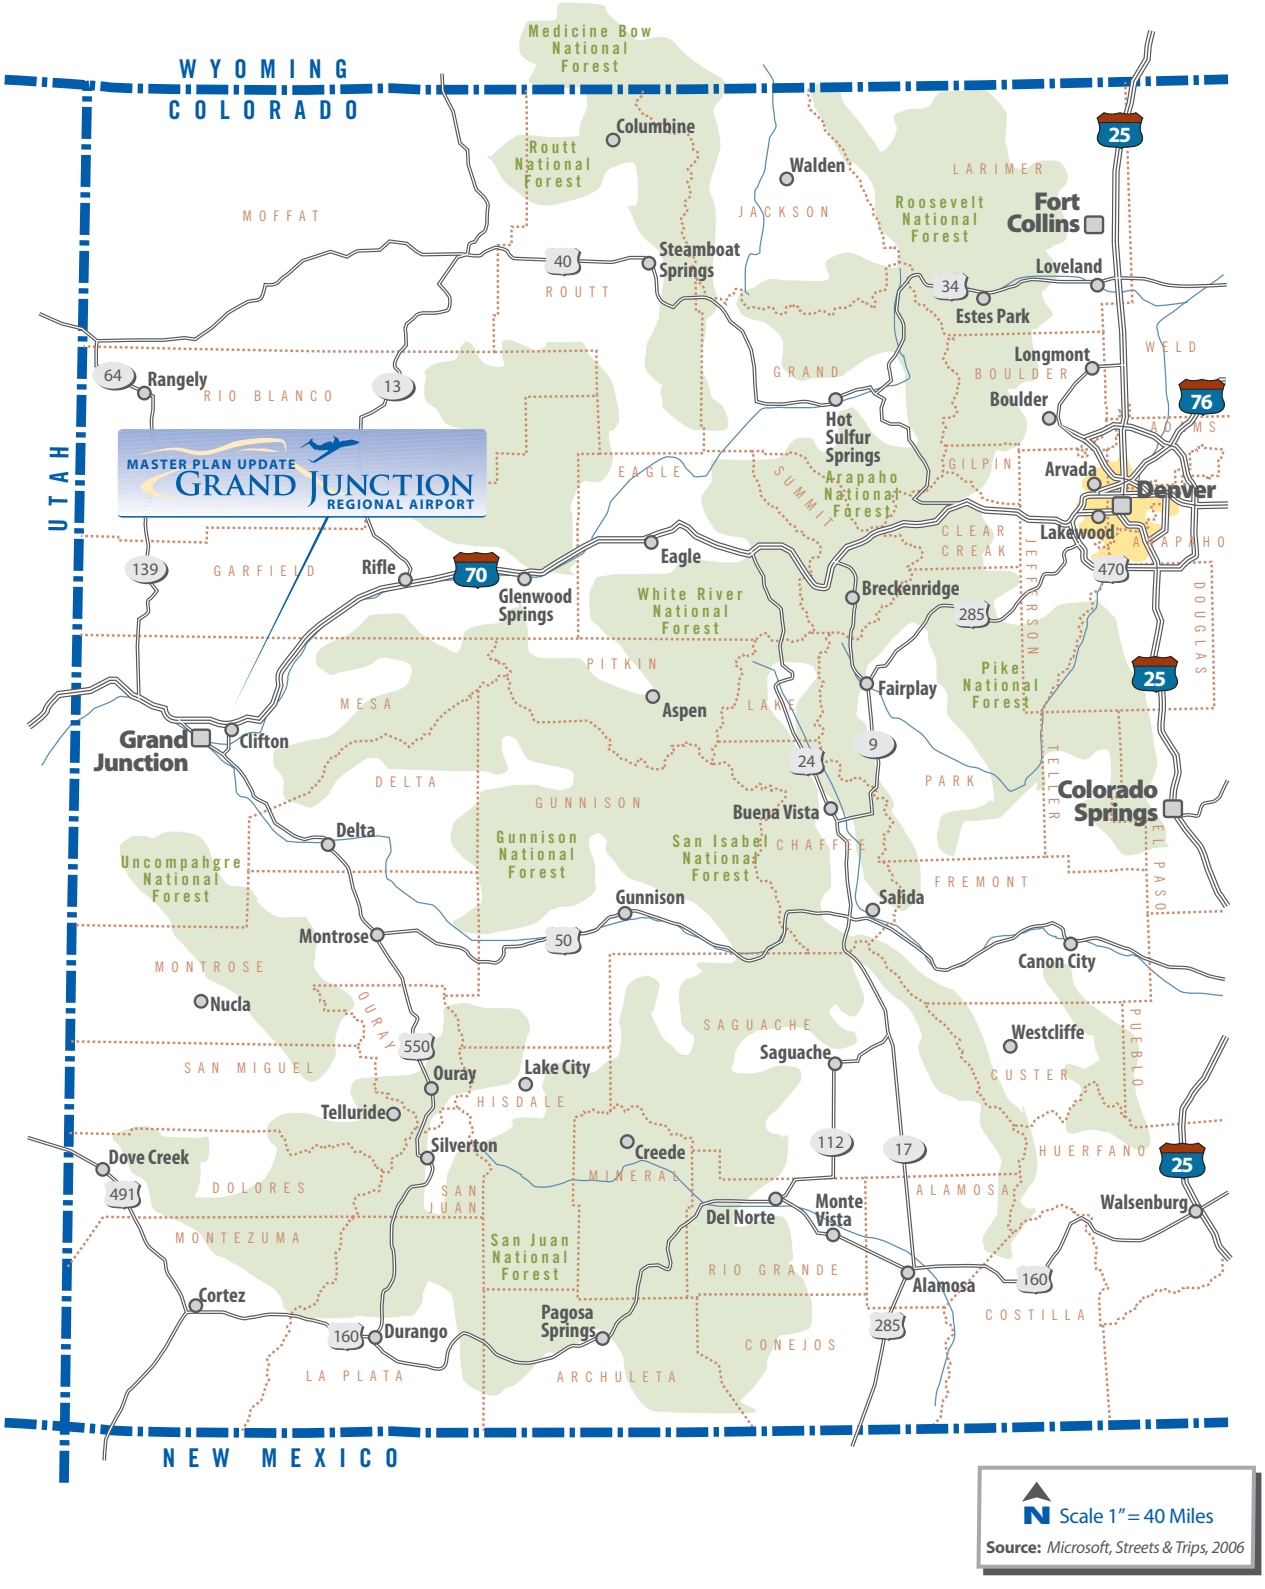

Figure A1 **Airport Location Map**

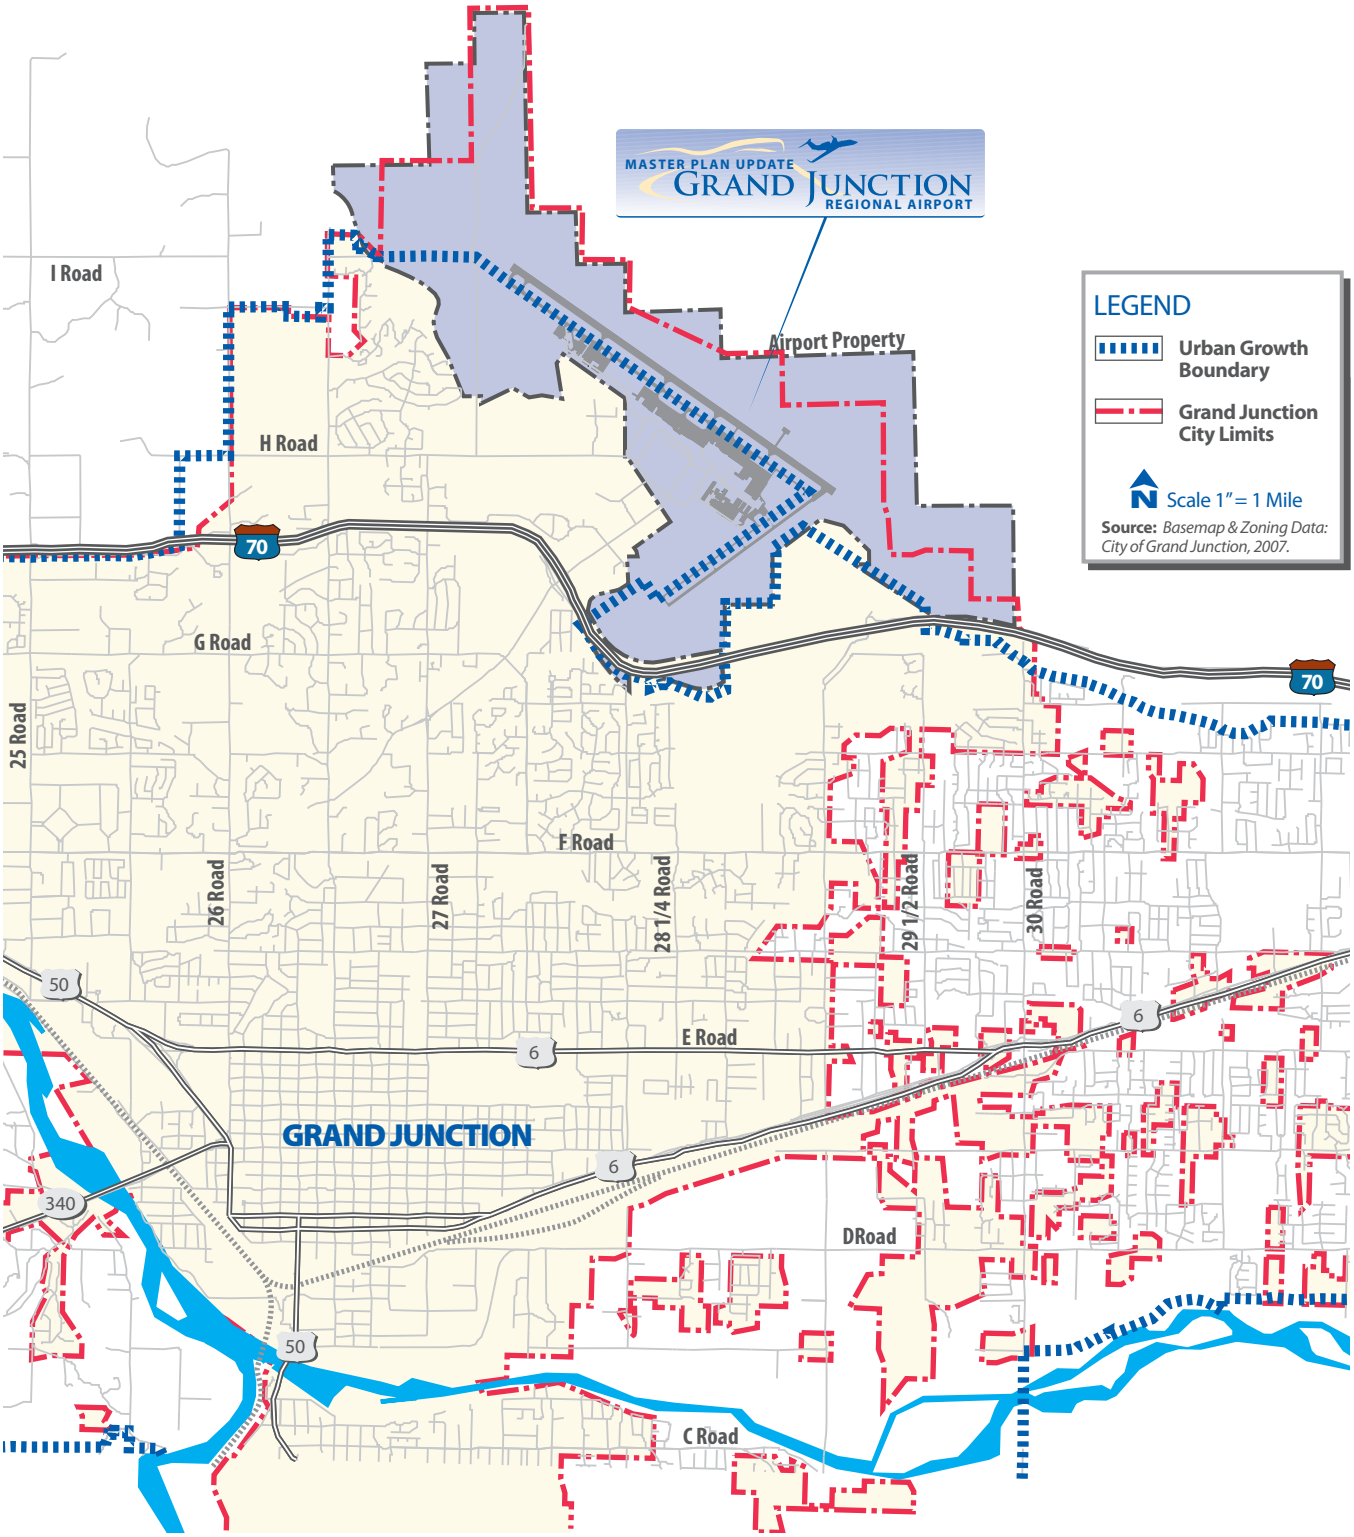

Figure A2 **Airport Vicinity Map**

Airport Facilities Inventory

Airside Facilities

Grand Junction Regional Airport is operated with two runways, along with parallel and connecting taxiways, which serve the runways and provide aircraft access to the terminal and other facilities on the Airport. The following illustration, entitled *EXISTING AIRPORT LAYOUT*, provides a graphic presentation of the existing airport facilities.

Runways. The primary runway at the Airport has a designation of 11/29. It is 10,501 feet in length and 150 feet in width. The runway is constructed of asphalt pavement with a porous friction course surface overlay and has a gross weight bearing capacity of 110,000 pounds single wheel, 180,000 pounds dual wheel, and 260,000 pounds dual tandem wheel main landing gear configuration. The runway is equipped with High Intensity Runway Lights (HIRL), a four light Precision Approach Path Indicator (PAPI) on the left side of Runway 11, a four light Visual Approach Slope Indicator (VASI) on the left side of Runway 29. Runway 11/29 is marked with precision approach runway markings. The Runway 11 end is served by an Instrument Landing System (ILS) approved for Category 1 ILS approaches and is composed of a localizer, a glide slope, and a Medium Intensity Approach Lighting System with Runway Alignment Indicator Lights (MALSR). In addition, Runway 29 has Runway End Identifier Lights (REILs).

The crosswind runway, Runway 4/22, has a length of 5501 feet and width of 75 feet. It is constructed of grooved asphalt and has a gross weight bearing capacity of 20,000 pounds single wheel, 30,000 pounds dual wheel main landing gear configuration. The runway is equipped with Medium Intensity Runway Lights (MIRL), a four light Precision Approach Path Indicator (PAPI) on the left side of Runway 4, and visual approach runway markings to both runway ends. Both runway ends are also equipped with Runway End Identifier Lights (REILs). Runway 4/22 is closed from 2200 (10 p.m.) to 0600 (6 a.m.) which coincides with the time the Airport Traffic Control Tower is closed.

Taxiways. In addition to the runways, the airside facilities at Grand Junction Regional Airport consist of several taxiways that provide access to the terminal area and other aviation facilities. A 75-foot wide full-length parallel taxiway, Taxiway A, serves Runway 11/29 with seven exit/connector taxiways, and is located on the southwest side of the runway. Runway 4/22 is served by a 40-foot wide full-length parallel taxiway, Taxiway C located on to the northwest side of the runway. Taxiway C has four exit connector taxiways. Taxiway A and its associated exit taxiway are illuminated by High Intensity Taxiway Lights (HITL) and signage. Taxiway B and its associated exit taxiways are illuminated by Medium Intensity Taxiway Lights (MITL) and signage.

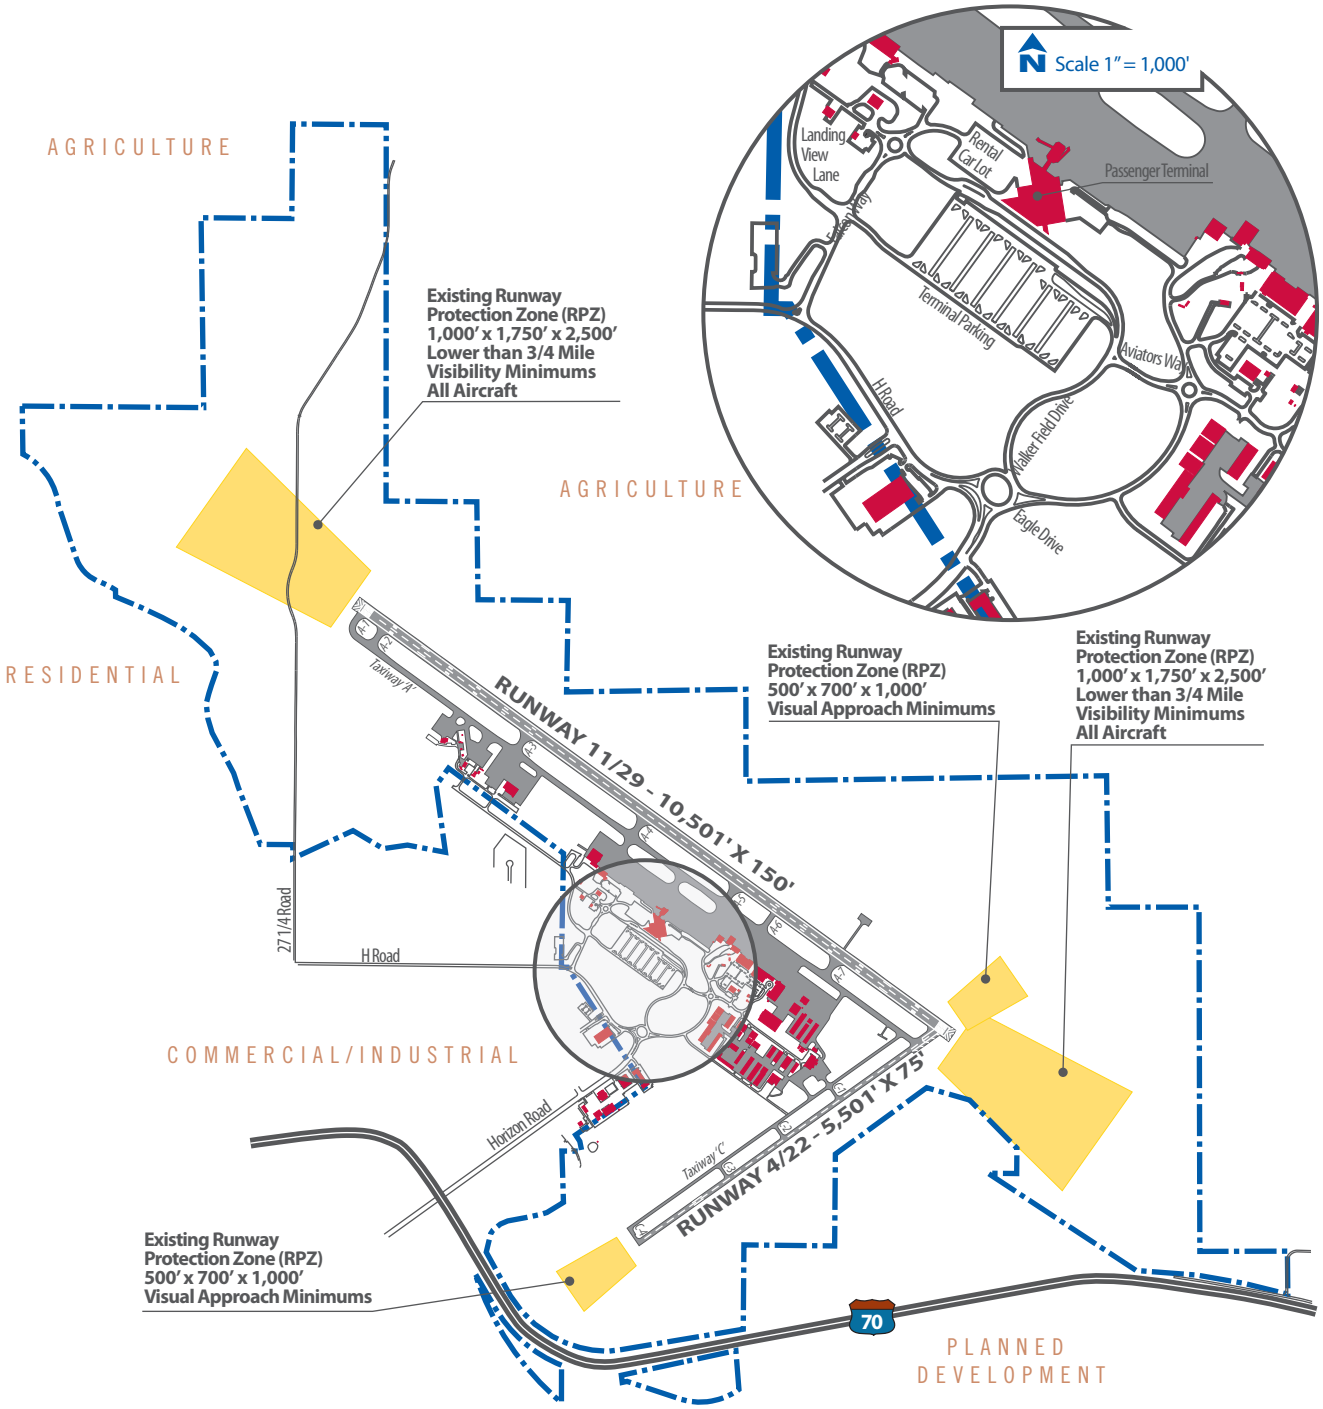

Figure A3 **Existing Airport Layout**

Landside Facilities

Landside development at the Airport includes commercial passenger terminal facilities, aircraft parking aprons, Fixed Base Operator (FBO) facilities, general aviation facilities, fuel storage facilities, and access roadways.

Passenger Terminal Facilities. The passenger terminal building at Grand Junction Regional Airport was opened in 1982 and originally consisted of approximately 70,000 square feet of space. The terminal is located on the south side of Runway 11/29 at approximately the midpoint of the runway. The three-level facility consists of airline ticketing counters, a baggage claim/handling area, passenger-waiting areas, rental car counters, a restaurant, a gift shop, airline and Transportation Security Administration (TSA) administrative offices, and Airport Authority offices. Arriving and departing passengers enter and exit the terminal building on the ground level and airline ticket counters, rental car counters and baggage claim are also located on the ground level. The second level consists of security screening, passenger waiting areas and boarding gates and the restaurant and gift shop. The third level consists primarily of the Airport Authority offices and TSA offices. There is an automobile parking facility located south of the terminal, support equipment parking east of the terminal and rental car parking west of the terminal.

Aprons. The commercial service aircraft parking apron at Grand Junction Regional Airport is located adjacent to the passenger terminal building, south of Runway 11/29. The primary general aviation apron is located east of the commercial service apron adjacent to the various FBO owned facilities. The west half of the general aviation apron is primarily reserved for larger corporate jet and turboprop aircraft parking and rotorcraft parking. The east half of the general aviation apron contain aircraft tiedowns for smaller aircraft.

There are also several other secondary apron areas located along both runways serving various airport tenants including general aviation and corporate aviation aircraft storage and maintenance, air cargo, air taxi and charter operators, and BLM firefighting operators. Additional apron areas at the Airport are devoted to various types of aircraft operational activities including aircraft maintenance engine run-ups and airline de-icing. There is a small run-up area located on the opposite side of Runway 11/29 from the general aviation apron.

A $3.5 million expansion and reconstruction project was completed for the commercial service and air cargo aprons in 2006. The project reconstructed a portion of the commercial service and cargo aprons and expanded the commercial service apron to the northeast to improve airline circulation and access to the terminal parking areas and gates. However, additional portions of the commercial service apron and the concrete general aviation aircraft parking apron adjacent

to the FBO facilities are both exhibiting signs of severe Alkali-Silica Reaction (ASR). ASR is a significant durability problem that results in premature deterioration of various types of concrete structures.

Fixed Base Operator (FBO) Facilities. West Star Aviation is the FBO located on airport property. The FBO facilities consist of several large aircraft storage and maintenance hangars. The FBO also maintains 74 aircraft tie-down spaces on the apron. Available services include fuel sales, aircraft maintenance, and aircraft modification. Additional aviation service providers at the Airport offer flight instruction, aircraft charter operations and aircraft maintenance from various hangar locations.

Hangar Facilities. The general aviation aircraft storage hangar area at the Airport is located south and east of the FBO facilities. There are three T-hangar facilities located southeast of the FBO facilities containing 38 aircraft parking spaces. Most of the hangars (with the exception of the T-hangars) are accessed via Taxilane C1-A which extends west from Taxiway C. In general, the hangar area has good landside access via Aviators Way and Navigators Way which extend east off of Eagle Drive. There are currently approximately 36 privately owned hangars on the airfield consisting of a mix of box hangars, clear span, shade-type hangars and T-hangars. There is also ample space to expand taxilanes and hangar facilities south of Navigators Way.

Fuel Storage Facility. Fuel is currently stored in above ground storage tanks located west of the Mesa Airlines Maintenance Hangar. The 100,000 gallon capacity facilities include storage for 68,000 gallons of Jet-A fuel and 32,000 gallons of 100LL AVGAS. The aircraft fueling service is currently provided by West Star Aviation via mobile refueling trucks. There is also a pilot self-serve fuel system located northeast of the Aero GJT T-Hangars. This service provides only 100LL AVGAS and is operated by Aero-Fuel.

Aircraft Rescue and Fire Fighting (ARFF) Facility. The ARFF facility is located east of the terminal building, adjacent to the Airport Authority owned hangar which is leased to FedEx. In accordance with 14 CFR Part 139, *Certification of Airports*, the Airport currently maintains an Index B ARFF capability, which is required by airports that accommodate five daily departures by commercial-use aircraft less than 126 feet in length (e.g., CRJ-700, B-737-700). The ARFF facility is staffed with ARFF certified airport personnel, who also perform airport maintenance duties such as snow removal, and mowing. This facility houses two ARFF vehicles that comply with 14 CFR Part 139 requirements, as well as snow removal equipment.

Airport Traffic Control Tower (ATCT). The ATCT at the Airport is located immediately east of the ARFF/SRE facility south of Taxiway A between connector taxiways A5 and A6. The ATCT

operates daily from 0600 (6 a.m.) to 2200 (10 p.m.) and is operated under the FAA's Contract Tower Program. Access to the ATCT is controlled through a security gate with prior telephone clearance.

Bureau of Land Management (BLM). The BLM Western Slope Fire Base facilities are located south of Taxiway A west of connector Taxiway A3. These facilities include an administration building, a helicopter office, a smoke jumper operations building, loading docks, two helipads, a bunkhouse, and a fire retardant storage area. The aircraft parking apron was recently reconstructed and expanded and consists of two air tanker loading pads with catchment basins. The three fire retardant storage tanks are all above-ground tanks and have a 32,000-gallon storage capacity.

National Weather Service. A National Weather Service weather station is located south of the ATCT and provides weather information for the area.

Automated Surface Observation System (ASOS). An Automated Surface Observation System (ASOS) is co-located with the glide slope antenna northeast of the approach end of Runway 11. This system is designed to provide 24-hour, minute-by-minute observations and performs the basic observing functions necessary to generate an aviation routine weather report and other aviation weather information. Information can be transmitted over a discrete VHF radio frequency or the voice portion of a local NAVAID. The Automated Terminal Information System (ATIS) is a looped recording that plays continuously over the radio. The ATIS represents the official current weather at the Airport; however, pilots can obtain up-to-the-minute weather information from either automated system.

Vehicular Access and Parking. As can be seen in the previous illustration entitled *EXISTING AIRPORT LAYOUT*, Grand Junction Regional Airport is accessed via Horizon Drive from the south or H Road from the west. Both roads connect to Walker Field Drive, which is a terminal access loop roadway. Horizon Drive becomes Walker Field Drive at the airport boundary and continues in a one-way counterclockwise flow between the terminal and airport parking before continuing south and reconnecting with H Road.

The entrance portion of Walker Field Drive extends north from the large round-a-bout at the airport entrance and is operated as a two lane road, while the portion of Walker Field Drive in front of the terminal building widens to four lanes. The inside lane adjacent to the terminal curb is designated for passenger loading/unloading. There is also a designated shuttle bus parking area off Walker Filed Drive immediately northwest of the terminal building. Walker Field Drive continues past the terminal building where it merges with Falcon Way with a four-

way round-a-bout at the intersection of the two roads. Rental car facilities are accessed via Falcon Way with rental car maintenance facilities located northwest of the round-a-bout and rental car pickup and return parking located northeast of the round-a-bout.

Additional commercial and general aviation facilities located northwest of the terminal area are accessed either by way of Falcon Way or Landing View Lane, which extends west from Falcon Way. The majority of general aviation and air cargo facilities is located southeast of the terminal area and is accessed via Eagle Drive, which extends east from the round-a-bout at the intersection of Horizon Drive, Walker Field Drive and H Road. Additional access roads in the general aviation and air cargo areas include Blue Angel Lane, Aviators Way, Heritage Way, and Navigators Way.
The entire airport access road and vehicle parking system was reconstructed in 2007 with some road realignments to improve access and traffic flow. Roads that were realigned or reconstructed include Walker Field Drive, Falcon Way, Eagle Drive and Aviators Way.

The vehicle parking area serving the passenger terminal was also reconstructed in 2007 and is located immediately south of the terminal. The redesigned parking area provides for 552 standard parking spaces, 30 handicap parking spaces, 12 motorcycle parking spaces and 38 recreational vehicle spaces. The parking areas are accessed by a dual entrance road system from the northbound section of Walker Field Drive. The exit from the parking area connects with the Falcon Way.

Airspace System and NAVAIDS

Grand Junction Regional Airport, as with all airports, functions within the local, regional, and national system of airports and airspace. The following illustration, entitled *AIRSPACE/NAVAIDS SUMMARY*, and narrative provide a brief description of Grand Junction Regional Airport's role as an element within these systems.

Air Traffic Service Areas and Aviation Communications

FAA air traffic controllers, stationed in Air Route Traffic Control Centers (ARTCC), provide positive air traffic control within defined geographic jurisdictions. There are some twenty-two geographic ARTCC jurisdictions established within the continental United States. Grand Junction Regional Airport is contained within the Denver ARTCC jurisdiction. The Denver ARTCC includes the airspace in all of Colorado and portions of Kansas, Nebraska, Wyoming, Utah, Arizona, and New Mexico.

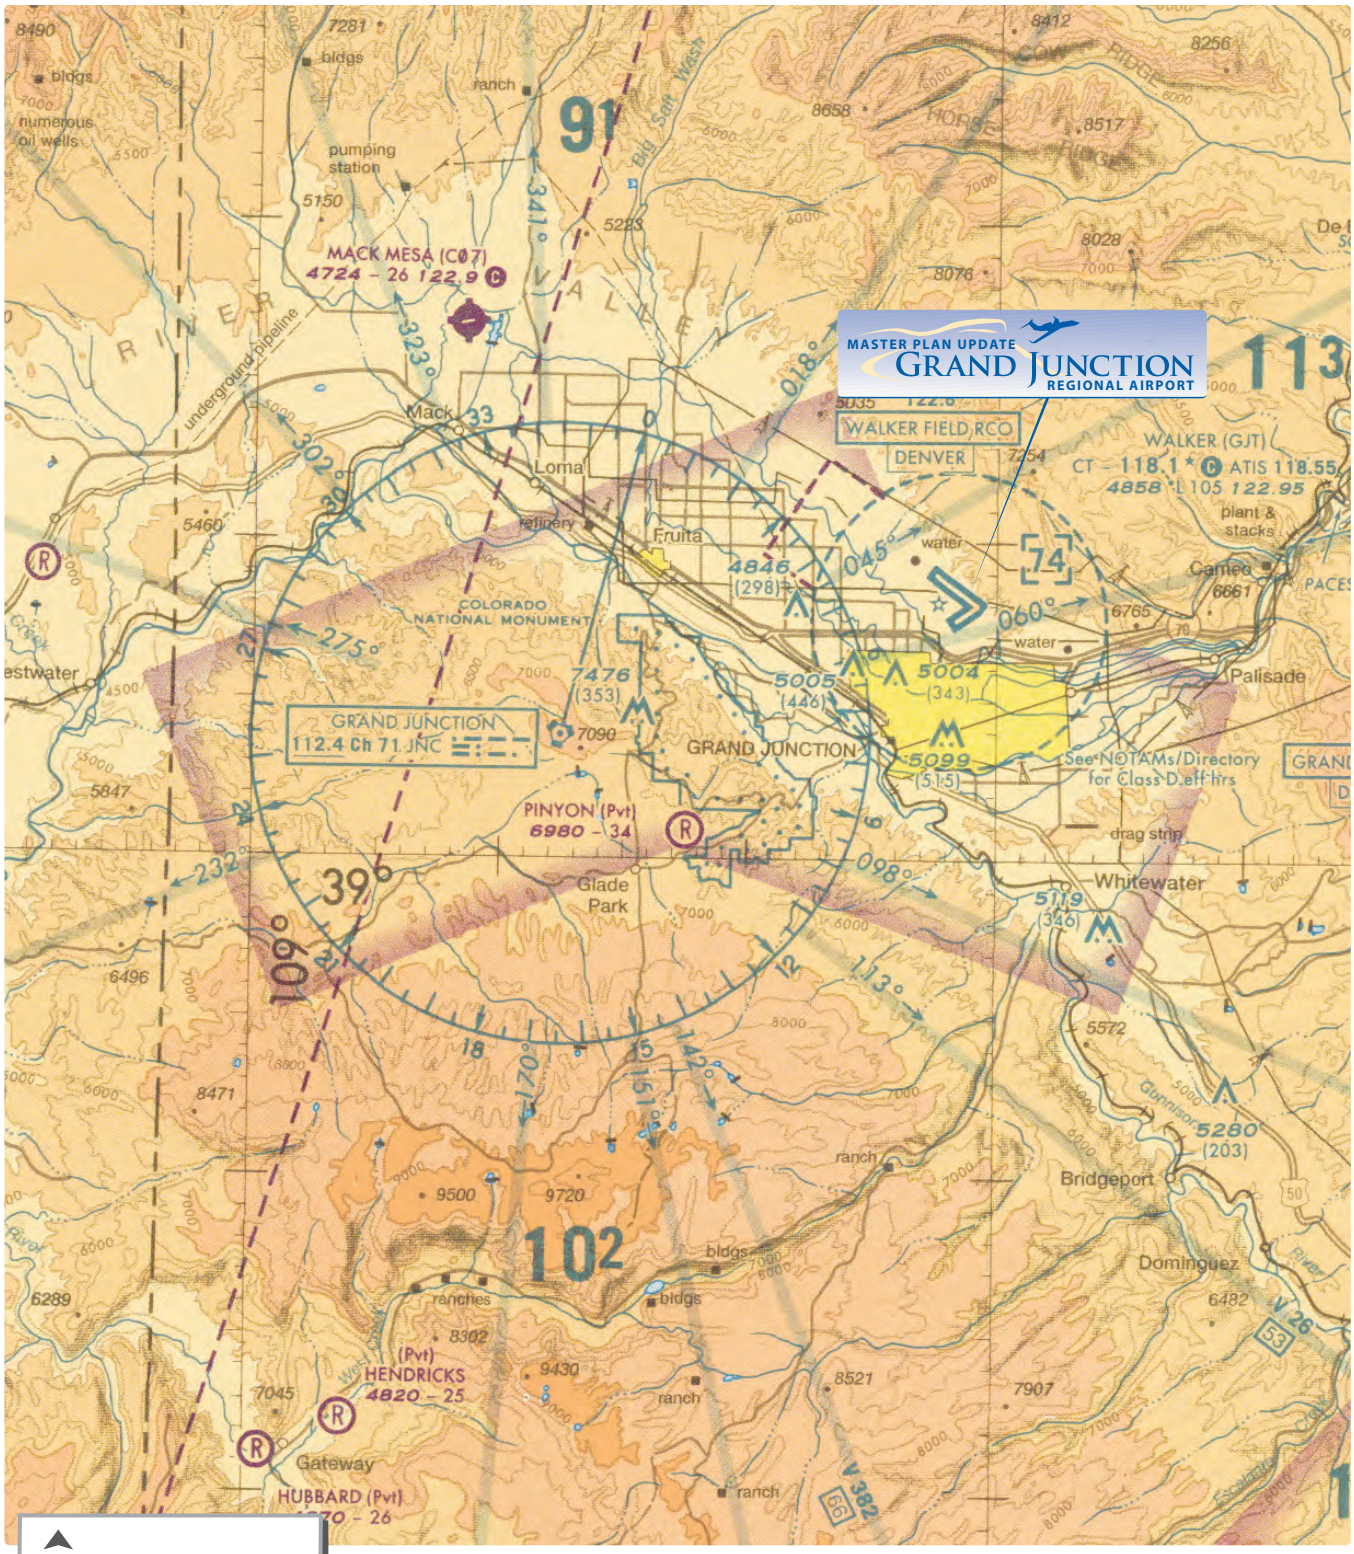
Aviation communication facilities associated with the Airport include the Grand Junction Airport Traffic Control Tower (frequencies: 118.1 CTAF and Ground, 121.7 Tower) and the Aeronautical Advisory Station (UNICOM) on frequency 122.95. In addition, the Airport has an Automated Terminal Information System (ATIS) that can be accessed on frequency 118.55. Denver Center ARTCC is accessed on frequency 119.7 and the Automated Surface Observing System (ASOS) can be accessed by phone.

Airspace

Grand Junction Regional Airport is a controlled airport with an ATCT open from 6:00 a.m. to 10:00 p.m. The immediate area surrounding the Airport is classified as Class D airspace (Class D airspace is that airspace from the surface to 2,500 feet above the airport elevation surrounding those airports that have an operational ATCT).

The Class D airspace extends from the airport elevation (4,858 feet MSL) to approximately 7,400 feet MSL. The airspace is circular in shape and extends five nautical miles from the center of the Airport. There is also a portion of Class E airspace associated with the Airport. The configuration of each Class E airspace area is tailored to individual airports. Generally, Class E airspace consists of the immediate controlled airspace and is intended to provide a transition area for instrument approaches. Radio communications and transponders are not required to operate under VFR conditions; however, IFR flights must be capable of communicating with ATC, currently Denver Center, and be Mode C Transponder equipped (capable of reporting altitude). The floor of the Class E airspace at Grand Junction Regional Airport is established at 700 feet above ground level (AGL).

Navigational Aids



A variety of navigational facilities are currently available to pilots in the vicinity of Grand Junction Regional Airport, whether located at the field or at other locations in the region. Many of these navigational aids are available to en-route air traffic, as well. In addition, there is a complement of navigational aids (NAVAIDS) that allow a variety of instrument approaches to the Airport.

The navigational aids (NAVAIDS) available for use by pilots in the vicinity of the Airport are Non-Directional radio Beacon (NDB) facilities, VHF Omnidirectional Range/Tactical Air Navigation (VORTAC) facilities, and VHF Omnidirectional Range/Distance Measuring Equipment (VOR/DME) facilities. NDBs are general purpose low- or medium-frequency radio beacons that an aircraft equipped with a loop antenna can home in on or determine its bearing relative to the sending facility. VORTAC and VOR/DME systems are Very High Frequency Omnidirectional Range Station with Distance Measuring Equipment transmitting very high

frequency signals, 360 degrees in azimuth oriented from magnetic north. The DME equipment is used to measure, in nautical miles, the slant range distance of an aircraft from the navigation aid. While both systems provide virtually the same types of information, the main difference between the VORTAC and VOR/DME is a VORTAC has co-located military tactical air navigation (TACAN) equipment with the VOR. TACAN, developed by the military, is a pulse system operating in the UHF band of frequencies

The Grand Junction VORTAC (112.4 JNC) is located approximately 13 nautical miles west of the Airport. Additional navigational aids within the vicinity of Grand Junction Regional Airport include the Rifle (RIL 110.6) VOR/DME, located 43 nautical miles (NM) to the northeast and the Montrose (MTJ 114.9) VOR/DME located 48 NM southeast of the Airport and the Hopkins (HPL 375) NDB is located approximately 54 NM south of the Airport.

Presently, there are six published straight-in instrument approach procedures published for Grand Junction Regional Airport. These are listed in the following table, entitled *INSTRUMENT APPROACH PROCEDURES*.

Source: *Sectional Aeronautical Charts, Denver North) Volume 0706, June 2007.*

Figure A4 **Airspace/NAVAIDS Map**

Table A1
INSTRUMENT APPROACH PROCEDURES

Approach	Designated Runway(s)	Ceiling Minimums (AGL)	Visibility Minimums
ILS	Runway 11	200′ AGL	2,400 Feet[1]
LOC	Runway 11	367′ AGL	2,400 Feet[2, 3], 4,000 Feet[4]
RNAV (GPS)	Runway 11	427′ AGL	½ mile[2], ¾ mile[3], 1 mile[4]
RNAV (GPS)	Runway 29	482′ AGL	1 mile[2], 1¼ mile[3], 1½ mile[4]
LDA/DME	Runway 29	542′ AGL	1 mile[2], 1½ mile[3], 1¾ mile[4]
ILS[5]	Runway 11	200′ AGL	1,800 Feet[1]

1. Authorized for use by Category A, B, C and D aircraft.
2. Authorized for use by Category A and B aircraft.
3. Authorized for use by Category C aircraft.
4. Authorized for use by Category D aircraft.
5. Special Aircraft Certification Required.

In addition, several existing visual navigational aids are located on the Airport and are available to pilots. These include a rotating beacon located on top of the ATCT and a lighted wind cone with segmented circle, which is located near the intersection of Runways 29 and 22. A network of low-altitude published airways (victor airways), in the vicinity of Grand Junction Regional Airport, also traverse the area, which spans between the regional ground based VOR equipment. Victor airways include the airspace within parallel lines located four NM on either side of the airway and extend 1,200 feet above the terrain to, but not including, 18,000 feet AMSL.

Airport Drainage System Planning

Building on drainage planning work that has previously been prepared for the Grand Junction Regional Airport and the surrounding area, a master drainage report for development of an appropriate storm water drainage and detention system has been prepared during this planning process and is included herein as Appendix One.

Airport Infrastructure Planning

An infrastructure inventory and assessment of future system potentials was also prepared. The inventory includes the major components of the water, sanitary sewer, electrical, natural gas, and telecommunication systems on the Airport and in the vicinity of the Airport that would be potentially available to accommodate future on-airport facilities. The complete Master Utility Report is included herein as Appendix Two.

Airport Environs

An inventory of the land uses, zoning patterns, and the various land use planning and control documents used to guide development of property surrounding the Airport is an important element in the airport planning process. Land use compatibility with airport development is made through knowledge of what land uses are proposed and what, if any, changes need to be made.

Grand Junction Regional Airport is located four miles northeast of downtown Grand Junction. The following paragraphs provide a generalized description of the existing zoning and future land use patterns for the areas surrounding the Airport.

Existing Zoning

The City of Grand Junction and Mesa County both have zoning and development codes that help guide development. The City's zoning and development code pertains to the area within its corporate limits and is intended to enable the City to uniformly and consistently evaluate, improve and approve, as appropriate, development, changes to existing uses, future uses and activities and to promote the health, safety and general welfare of the citizens and residents of the City. The County's land development code pertains to the unincorporated area surrounding the Airport and is intended to preserve and improve the public health, safety and general welfare of the citizens and businesses of Mesa County.

Airport property in the City's zoning and development code is zoned Public Airport District (PAD) which is a nonresidential zoning district. Areas to the south and west of the Airport consist of various zoning districts including both Residential and Nonresidential zoning districts. Some of these districts include Residential Single Family (RSF-4), Residential Multifamily (RMF-5), Light Commercial (C-1), Industrial/Office Park (I-O), and Planned Development (PD). Chapter 7 of the City's zoning and development codes includes a special regulation entitled Airport Environs Overlay Zoning District (AE) intended to protect public health, safety and welfare by regulating development and land use within noise sensitive areas and airport hazard areas. The AE district is also intended to ensure compatibility between the Airport and surrounding land uses and protect the Airport from incompatible encroachment. The AE district includes four subdistricts labeled Subdistrict A (Airport Area of Influence), Subdistrict B (Airport Noise Zone), Subdistrict C (Airport Critical Zone), and Subdistrict D (Airport Clear Zone). The AE district also includes a land use compatibility matrix and height limitations based on 14 CFR Part 77, *Objects Affecting Navigable Airspace*.

Areas to the north and east of the Airport are outside of the existing corporate city limit boundary and are subject to the provisions on the Mesa County land development code. The majority of the land north and east of the Airport is owned by the BLM and is zoned by Mesa County as Agricultural, Forestry, Transitional district (AFT). The AFT district is primarily intended to accommodate agricultural operations and very low-density single-family residential development. The Mesa County land development code also includes an Airport Overlay Zoning district (AE) with the identical purpose and subdistrict zones as the City's AE. Existing zoning is depicted in Figure A5, entitled *GENERALIZED EXISTING ZONING*.

Future Land Use

The City of Grand Junction adopted a plan in 1996 known as the "Growth Plan." The Growth Plan is a statement of the community's vision for its future and a road map providing direction to achieve that vision. The Plan was designed, though an intergovernmental agreement, to be applicable to both Mesa County and the City of Grand Junction.

The Growth Plan includes a Future Land Use Map showing recommended land uses surrounding the Airport. Recommended land uses south and west of the Airport include primarily commercial and commercial industrial with some medium density residential land uses adjacent to airport property. Recommended land uses north and east of the Airport include agricultural and rural.

Included in the Growth Plan are goals and policies for future development. Goal 8 is "to support the long-term viability of existing centers of community activity as shown in Exhibit V.5, *Existing Centers of Activity Map*." Grand Junction Regional Airport lies within one of five centers of activity identified by the City, and known as "Airport Environs/Horizon Drive."

Two specific policies are identified in the Growth Plan related to the Airport Environs/Horizon Drive center of activity. These policies are listed below:

- Policy 8.4: The City and County will encourage the development of uses that are compatible with the airport and the image of this area as a gateway into Grand Junction, particularly: office/warehousing; and light industrial/indoor manufacturing near the airport; and highway-oriented commercial development serving tourists and visitors (*e.g.*, lodging, recreation and restaurants) along Horizon Drive between Crossroads Blvd. and G Road.
- Policy 8.5: The City and County will prohibit inappropriate development within the airport's noise and approach zones.

The Implementation Strategies section of the Growth Plan includes action items which were last updated in 2003. The action item related to the Airport is listed as follows:

> 2. Area Plans, Corridor Plans and Neighborhood Programs
>
> a. Participate in public hearings on the Airport Master Plan and ensure it is consistent with the Growth Plan. Adjust Horizon Drive area commercial zoning to promote the development of Horizon Drive lodging and other tourist oriented services. Commercial development in the vicinity of the airport should be limited to airport related businesses and high quality business park uses designed to project an attractive entry into the community for airport passengers.

The future land use plan for the City of Grand Junction and Mesa County is shown in Figure A6, entitled *GENERALIZED FUTURE LAND USE*. The Urban Growth Boundary shown in Figure A6 indicates the urban areas for the purposes of land use analysis for the City and County.

Existing Land Use

Typically, existing land use patterns follow closely to what is portrayed on the local zoning map. When viewing the aerial photograph for Grand Junction Regional Airport, land use patterns do indeed resemble what is illustrated in the existing zoning map for the City of Grand Junction.

Airport Environs Overlay Zoning District

As stated previously, the City of Grand Junction has established an Airport Environs Overlay Zoning District that includes Subdistrict A Airport Area of Influence, Subdistrict B Noise Zone, Subdistrict C Critical Zone and Subdistrict D Clear Zone. The Area of Influence is described as an area surrounding the Airport impacted or influenced by proximity of the Airport either by aircraft overflight, noise and/or vibrations. The Noise Zone includes the area within the 65 Ldn to 70 Ldn noise-exposure area as shown in the Grand Junction Regional Airport Master Plan (the noise zone is currently shown on the Mesa County zoning map, but not the City of Grand Junction zoning map). The Critical Zone is a rectangular-shaped zone located directly off the end of each runway's primary surface (or 200 feet from the end of pavement) which is critical to aircraft operations (i.e. more apt to have accidents within it because of the takeoff and landing mode in that particular area). The Clear Zone is a trapezoidal-shaped zone also beginning 200 feet from the end of the pavement, which is to remain clear of all above-ground obstructions or construction. The Clear Zone dimensions match the dimension of the Runway Protection Zone (RPZ) as shown on the Airport Layout Plan (ALP).

The boundaries of the Airport Environs Overlay Zoning District and its subdistricts shall be

reviewed whenever the Grand Junction Regional Airport Authority updates and/or amends the noise contour maps and/or master plan. The Grand Junction Regional Airport Authority shall notify the City of any such update and/or amendment and provide a copy of it to the City. These zones are shown on Figure A7, entitled *AIRPORT ENVIRONS OVERLAY ZONING DISTRICT*.

Summary

The goal of this chapter is to provide general background information pertaining to Grand Junction Regional Airport, its aviation-operating environment, and its physical surroundings. The *Inventory* chapter is vital from the standpoint that it will be used as a reference in the analysis and design process, which is required to prepare the airport's future development plan.

The next step in the planning process is to formulate forecasts for the quantity and type of future aviation activity expected to occur at the Airport during the forthcoming twenty years.

Forecasts

B. Forecasts of Aviation Activity

MASTER PLAN UPDATE

GRAND JUNCTION

REGIONAL AIRPORT

B. Forecasts of Aviation Activity

Forecasting is a key element in the master planning process. The forecasts are essential for analyzing existing airport facilities and identifying future needs and requirements of the facilities. Forecasting, by its very nature, is not exact, but it does establish some general parameters for development and provides a defined rationale for various development activities as demands increase. The amount and kind of aviation activity occurring at an airport are dependent upon many factors, but are usually reflective of the services available to aircraft operators, the local/regional demand for commercial passenger services, the meteorological conditions under which the airport operates (daily and seasonally), the businesses located on the airport or within the community the airport serves, and the general economic conditions prevalent within the surrounding area.

Aviation activity forecasting generally commences by utilizing the present time as an initial point, supplemented with historical trends obtained from previous years' activity and recorded information. This data has evolved from a comprehensive examination of historical airport records provided by airport personnel, *Colorado Aviation System Plan, 2005*, FAA Form 5010-1 data, *FAA Terminal Area Forecasts*, and the *FAA Aerospace Forecasts Fiscal Years 2008-2025*. These documents were assembled in different years, making the base year data quite variable, and emphasizing the need for establishing a well-defined and well-documented set of historical information from which to project future aviation activity trends.

Prior to an examination of current and future activity levels at the Airport, there are several conditions and assumptions that should be noted, which form the basis or foundation for the development of the forecasts contained herein. These statements cover a wide variety of physical, operational, and socioeconomic considerations and, although not necessarily in order of importance or priority, include:

- **Weather Conditions.** Existing weather data (i.e., visibility, ceiling, and wind conditions) for Grand Junction Regional Airport were available for analysis from the National Oceanic and Atmospheric Administration (NOAA). With the

exception of very few days annually, the Airport is not adversely affected by poor weather conditions. Visual Flight Rules (VFR) meteorological conditions are experienced approximately 94.8% of the time annually; therefore, aircraft can operate at the Airport on a regular basis throughout the year, with limited interruption due to weather. The potential negative impact of poor weather conditions on the operational capability of the Airport is documented in the next chapter of this document. This information will be analyzed and evaluated in later chapters regarding the identification of potential instrument approach facility enhancements and the preparation of development alternatives for their implementation.

- **Airport/Community Location, Proximity, and Role.** Grand Junction Regional Airport is uniquely situated geographically in west-central Colorado. The airport service area for passenger and air cargo includes much of western Colorado and eastern Utah. A significant amount of the deplaned air cargo at the Airport is loaded on trucks for delivery to destinations outside of Grand Junction.

- **Regional Socioeconomic Conditions.** The existing socioeconomic condition of a particular region has historically impacted aviation activity within that area. The two primary socioeconomic indicators, which are often analyzed in the forecasts of aviation activity, are population and employment statistics.

  According to the latest population data prepared by the U.S. Census Bureau, the estimated Mesa County population in 2007 totaled 139,082 residents. This service area population group has increased at approximately 2.8 percent annually since 2000. The year 2025 population projections for the Grand Junction Metropolitan Statistical Areas (MSA) are expected to reach a total of 199,866, reflecting an average annual growth rate of 2.6 percent. This compares to a projected statewide average annual growth rate of approximately 2.2 percent for the same period. According to the Colorado Demography Office, employment for Mesa County in 2005 was 70,917. Employment for Mesa County through the year 2025 is projected to increase to 102,046. This equates to an average annual growth rate of 2.2 percent for the years 2005 through 2025.

- **Additional Growth Indicators.** According to the Grand Junction Economic Partnership, the Gross Metropolitan Product (GMP) increased at an average annual growth rate of over 8 percent from $5.8 billion in 2005 to $6.3 billion in 2006. The median home price in Grand Junction has significantly increased in

recent years. According to the Colorado Association of Realtors, the 2000 Median Home Price of $120,100 had increased to $209,783 by March of 2007, an almost 75 percent increase. Finally, the City of Grand Junction Financial Operations Department reported a surge in sales tax receipts from $4.91 million in January of 2007 to approximately $5.29 million in January of 2008.

- **Community Support.** Grand Junction Regional Airport benefits from the support of the surrounding cities and county governments, as well as local industry and residents. The Airport is recognized as a vital asset to both the City of Grand Junction and Mesa County, which contributes to the stability and the future of the area's economy. The overall position of the area is one of continued growth and development, with special focus on the impetus that the Airport provides to maintain and attract additional economic and aviation-related development to the region.

  Additionally, many of the surrounding county communities and much of the west-central Colorado region benefit from the close proximity of a regional commercial service aviation facility and, in turn, provide an economic base that can attract additional based aircraft, as well as industrial/business development to the Airport. This impact is realized by a study, *The Economic Impact of Airports in Colorado, 2003*, completed by the Colorado Aeronautics Division, for all Colorado airports. According to the 2003 Study (an update is planned for 2008), Grand Junction Regional Airport generated $276.9 million in economic activity, $108.5 in annual wages, and 3,667 jobs in 2002. Economic activity was defined as the "economic contribution" of the Airport to the region and state economy in terms of total jobs, wages, and economic activity (business receipts).

- **Facilities Potential.** Grand Junction Regional Airport currently serves a vital commercial passenger service role to the economy of west-central Colorado. From a runway length standpoint (10,501 and 5,501 feet), it is one of only a few airports within the regional service area that can accommodate the operation of air carrier jet aircraft. In addition, the Airport can accommodate the operation of large business jet aircraft that may be restricted from operating at the region's other general aviation airports.

- **Negative or Neutral Factors.** As a general comment, the Airport has very few negative factors and is in an enviable position, due to its many positive features and conditions. However, there are some broad factors that can have a negative

or neutralizing impact on the Airport, and the aviation industry, and these are considered in the planning process.

From a national perspective, one negative factor is the current state of the national economy including record high oil prices, contributing to higher air fares. The economic condition of many of the hub-and-spoke "legacy" airlines is also of concern. This is being offset to a great degree by the positive economic conditions being experienced by the low-cost carriers.

The overall condition of the general aviation industry in the United States has been a negative factor for several years. Beginning in 1978, many sectors of the general aviation industry have been in recession. The FAA has identified several factors that precipitated this downturn, including economic recessions, fuel crises, the termination of the GI Bill, and the repeal of the Investment Tax Credit. Factors including the rising expense of owning and operating an aircraft (i.e., costs of insurance, fuel, and maintenance), increases in airspace restrictions affecting fair-weather flying, reductions in personal leisure time, and shifts in personal preference as to how leisure time is spent have tended to restrict the single engine light aircraft segment of the industry, in particular.

There are also a number of bright spots having a positive impact in certain segments of the general aviation industry. They include the passage of the General Aviation Revitalization Act (GARA) of 1994 and the more recent FAA Sport Pilot and Light Sport Aircraft Rules. The GARA legislation has caused renewed interest and optimism among U.S. aircraft manufacturers, who are either re-entering the single engine aircraft market after several years' absence, or are increasing future production schedules to meet expected renewed demand. Response to the Sport Pilot and Light Sport Aircraft rule, the growth in the amateur-built aircraft market, and the strength of the used aircraft market, all indicate that demand for inexpensive personal aircraft is still relatively strong.

Historical Airport Activity Summary

A tabulation of Grand Junction Regional Airport's historical aviation activity since 1997 is presented in Table B1, entitled *HISTORICAL AVIATION ACTIVITY, 1997-2007*. This table presents a summary of historic aviation activity at the Airport, which includes both local and itinerant operations, total operations and total enplanements.

Table B1

HISTORICAL AVIATION ACTIVITY, 1997-2007

Year	Enplane-ments	Itinerant Air Taxi/Air Carrier Ops	Itinerant GA Ops	Itinerant Military Ops	Total Itinerant Ops	Local GA Ops	Local Military Ops	Total Local Ops	Total Ops
1997	140,370	21,501	37,879	1,649	61,029	23,032	1,592	24,624	85,653
1998	140,435	24,250	44,162	2,144	70,555	27,163	2,812	29,975	100,530
1999	139,532	25,061	44,317	2,839	72,216	31,294	3,981	35,275	107,491
2000	136,611	24,445	44,946	3,080	72,471	30,487	3,688	34,175	106,649
2001	120,057	21,116	40,857	2,803	64,776	35,032	4,008	39,040	103,816
2002	125,441	21,381	43,910	2,004	67,295	34,484	3,121	37,605	104,899
2003	127,584	21,219	38,495	1,683	61,397	31,503	2,952	34,455	95,852
2004	144,027	22,997	36,981	1,775	61,753	28,128	3,049	31,177	92,930
2005	159,715	23,698	33,692	2,455	59,846	23,066	4,000	27,066	86,911
2006	160,307	21,886	31,701	2,113	55,700	20,165	2,402	22,568	78,267
2007	170,836	22,150	30,012	2,122	57,284	21,760	3,702	25,462	82,745

Source: *Grand Junction Regional Airport Authority.*

As can be seen, the number of annual total aircraft operations (an operation is defined as either a takeoff or a landing) at Grand Junction Regional Airport has fluctuated to some degree through the last ten years. Annual counts have ranged from a low of 78,267 operations in 2006 to a high of approximately 107,491 operations in 1999.

- **Passenger Enplanements.** Enplanements have increased significantly since the 2001 low of 120,057. This upward trend is likely to continue as additional airlines initiate service and provide an increased level of competition.

- **Air Carrier/Air Taxi Aircraft Operations**. The Airport Traffic Control Tower (ATCT) located on the field records aircraft operations during its operating hours. Nighttime aircraft operations when the tower is closed (10:00 p.m. to 6:00 a.m.) are estimated to be approximately 10 percent of daytime operations totals. Additionally, the majority of commercial service operations are conducted by air taxi/commuter carriers with a small number of commercial service operations (approximately 1,361 in 2007). Air taxi/commuter operations are defined air those conducted by aircraft with less than 60 seats, while air carrier operations are those conducted by aircraft with more than 60 seats.

- **General Aviation Operations.** General aviation operations are typically more directly tied to economic conditions than commercial passenger operations, and this trend is often reflected in the historical operations data for a particular airport. The amount of general aviation activity at many airports around the country has remained flat or declined since the early 1980s. The data available for Grand Junction Regional Airport illustrates fluctuations in general aviation activity since 1997. As economic conditions in the region change in the future, fluctuations in the number of general aviation operations at the Airport will likely continue; although, the increasing trend from 2006 to 2007 is expected to continue over the short-term.

- **Military Operations.** Historically, military aircraft have utilized Grand Junction Regional Airport for training and/or refueling purposes. The majority of these operations are typically associated with either single engine piston trainer aircraft or either A-6A Prowler or F-18 Hornet jet aircraft. The Airport also accommodates occasional operations by large military taker/refueler type aircraft such as the KC-135 and the C-130. Military operations during 2007 were approximately 5,824 and are expected to remain roughly the same throughout the planning period.

Historical Based Aircraft Summary

The number of aircraft that can be expected to base at any airport is dependent upon many factors, such as aircraft maintenance facilities, airport communication practices, services provided at the airport, airport proximity and access, and similar factors.

A historical summary of the annual number of reported based aircraft is provided in the following table entitled *HISTORICAL BASED AIRCRAFT, 2003-2007*. The data was compiled from FAA records and a recent based aircraft count conducted by airport personnel. There is an estimated 166 aircraft currently based at the Airport, of which 130 are single engine piston, 15 multi-engine pistons, 6 single engine turbo prop, 11 multi-engine turbo prop, 3 jets, and 1 helicopter.

Table B2

HISTORICAL BASED AIRCRAFT, 2003-2007

Year	Total
2003[1]	162
2004[1]	158
2005[1]	146
2006[1]	147
2007[2]	166[3]

[1] *Data obtained from FAA Terminal Area Forecast, December 2008.*

[2] *Grand Junction Regional Airport Authority personnel.*

[3] *Following the publication of the Draft Airport Master Plan in May 2009, the Airport conducted a thorough based aircraft count. The 2009 number of aircraft based at the Airport is 104. This is significantly lower than the 2007 estimate of 166 based aircraft; however, the implications for the recommended improvements included in this Master Plan Update are minimal. Storage facilities for additional based aircraft will not be constructed until there is sufficient demand for such facilities.*

Passenger Enplanements Forecast

It is important to note that two airlines initiated new commercial passenger service at the Airport in Spring 2008, and one airline has ceased service to the Airport. American Eagle started service on April 7, 2008 with 2 daily flights from Dallas on 50 seat Embraer 145 regional jet aircraft. Lynx Aviation, a subsidiary of Frontier Airlines, started service on May 15, 2008 with 4 daily flights from Denver on 74 seat Bombardier Q400 turbo-prop aircraft. Finally, Great Lakes Aviation ceased service with 19-seat Beech 1900 aircraft. Currently, the aircraft types associated with the scheduled commercial passenger operations at the Airport are regional/commuter aircraft (under 60 passengers) with the exception of Allegiant Air which serves the Grand Junction market with two weekly departures to Las Vegas utilizing McDonnell Douglas MD-83 aircraft (150 passengers).

Two historical trends and three forecast scenarios have been developed for the passenger enplanement forecast:

- **Scenario One (Low).** This scenario projects enplanements to increase at an average annual growth rate of 2.6 percent which is equal to the projected growth rate of the Grand Junction Metropolitan Statistical Area (MSA) through 2025.

- **Scenario Two (High).** In this projection, enplanements are expected to significantly increase in 2008 based on the increase of departure seats available in the spring of 2008 (an approximate 70% increase from 3,400 departure seats per week in 2007 to over 5,800 departure seats per week in 2008). In Scenario Two, enplanements are forecast to increase by 17 percent for the first year and then increase at an average annual growth rate of 3.8 percent, which is equal to the national enplanement growth rate from the FAA's Terminal Area Forecast (TAF), for the remainder of the planning period.

- **Scenario Three.** This scenario indicates that enplanements will increase at 10 percent per year for the first two years, based primarily on the new service initiated in early 2008, and then increase at the projected population growth rate of 2.6 percent through the rest of the planning period. The new service will likely result in a spike in passenger enplanements in 2008 and 2009 as reflected in Scenario Three.

- **Scenario Four (Selected).** This projection was also developed as a result of the increase in departure seats available. Scenario Five is based on the first 6 months of actual 2008 enplanement data and assumes that the approximate level of

19,500 enplanements per month (as realized in May and June of 2008) will continue throughout the second half of 2008 and through 2009 resulting in 212,887 enplanements in 2008 and 234,000 enplanements in 2009. Enplanements are then forecast to increase at the 2.6% population growth rate for the remainder of the planning period. Scenario Four is consistent with the historical trend in enplanements at the Airport since 2001.

The passenger enplanement scenarios are compared in the following table entitled *PASSENGER ENPLANEMENT FORECAST, 2007-2027*.

Table B3

PASSENGER ENPLANEMENTS FORECAST, 2007-2027

Year	FAA TAF	Trend Projection[2]	Trend Projection[3]	Scenario One (Low)	Scenario Two[5] (High)	Scenario Three	Scenario Four (Selected)
2007	168,771	170,836[1]	170,836[1]	170,836[1]	170,836[1]	170,836[1]	170,836[1]
2008	167,339	157,342	180,310	175,278	199,878	187,920	212,887
2009	169,936	159,719	189,388	179,835	207,473	206,712	234,000

Use of Various Forecasts

The recommended/selected forecast is the *Scenario Four (Base Case) Enplanement Forecast.* This base case projection will be submitted for FAA approval, and once approved, will be used through the Master Plan Update as the basis for facility needs documentation. However, both the Scenario One (low-range) and the Scenario Two (high-range) forecasts also have significant value that is recognized. The high and low forecast numbers can be utilized to help test Master

Plan recommendations for feasibility and flexibility. For example, the low-end forecast is often utilized to test for financial feasibility. The question, "If activity is lower than anticipated, can the development plan be funded?" can only be answered if low-end forecast numbers are known. The high forecast numbers are also required to answer the question, "Will programmed facilities be adequate in capacity if aviation activity grows at the maximum reasonable anticipated rate?"

Commercial Service Operations Forecast

Commercial service aircraft operations at Grand Junction Regional Airport are currently represented by a combination of turbo-prop, regional jet and narrow-body jet aircraft that are operated by six airlines. The following tables, entitled *2007 AND 2008 COMMERCIAL SERVICE CARRIERS*, provide the 2007 list of air carriers that provided service at the Airport and the 2008 list of air carriers at the Airport. As mentioned previously, recent service changes (Spring 2008) include the addition of both American Eagle and Lynx Aviation and the suspension of service by Great Lakes Aviation.

Table B4
2007 COMMERCIAL SERVICE CARRIERS

Airline	Aircraft Type	Seating Capacity	City/ Destination	Stage Length (NM)
SkyWest (United Express)	EMB 120, CRJ-200 & 700	30 to 66 seats	Denver, CO	184 NM
SkyWest (Delta Connection)	CRJ-200ER	50 seats	Salt Lake City, UT	188 NM
Mesa Airlines (United Express)	Dash 8-100 & 200, CRJ-200	37 to 50 seats	Denver, CO	184 NM
Mesa Airlines (US Airways)	Dash 8-100	37 seats	Phoenix, AZ	381 NM
Allegiant Air	MD-80	150 seats	Las Vegas, NV	364 NM
Great Lakes Aviation (United and Frontier)	Beech 1900	19 seats	Denver, CO	184 NM

Lynx Aviation (Frontier Airlines)	Dash 8-Q400	74 seats	Denver, CO	184 NM

Source: *Airline Flight Schedules.*

The establishment of projected passenger enplanements, in addition to identifying fleet mix, is required to properly project commercial service aircraft operations. The Boarding Load Factor (BLF) of the airlines serving an airport is one method of determining the forecast of commercial service operations. The BLF is the ratio of seats available for passenger boarding on a particular aircraft compared to the number of passengers actually boarding (for example, if an aircraft has fifty seats available and twenty-five passengers board, the BLF is 50 percent). According to recent FAA estimates included in the *FAA Aerospace Forecasts Fiscal Years 2008-2025*, average load factors of approximately 79.8 percent were anticipated to be achieved by the air carrier industry in 2008 and it is expected to increase to 81.6 by 2025. The BLF for the Grand Junction Regional Airport in 2007 was approximately 73 percent and is expected to increase only slightly by the end of the planning period.

The following table presents the commercial service operational forecasts, as well as enplanements, average seats per departure and the projected BLFs. As can be seen in the table, the average seats per departure figure is anticipated to significantly increase in the first five years due to the change in the commercial aircraft fleet including the addition of both the 50-seat Embraer 145 (American Eagle) and the 74-seat Bombardier Dash 8, Q400 (Lynx Aviation) and the subtraction of the 19-seat Beech 1900 (Great Lakes Aviation). It is anticipated that the passenger demand can be accommodated with increases in the number of flights by the same airline equipment over the 20-year planning period. While no changes are anticipated in the

commercial airline fleet mix, it is likely that the 70- to 90-seat regional jets will be more frequently utilized to serve the Airport in accordance with the aircraft capacity forecasts included in the *FAA Aerospace Forecasts Fiscal Years 2008-2025*. Thus, the number of seats per departure at the Airport is expected to increase slightly.

Table B6

COMMERCIAL SERVICE OPERATIONS FORECAST, 2007-2027

	Seats	2007	2012	2017	2022	2027

General Aviation Operations Forecast

The general aviation market at the Grand Junction Regional Airport has undergone significant changes in past couple of years that have likely contributed to the first annual increase in total aircraft operations at the Airport since 2002. These changes include the addition of a self-service fueling facility and a change in ownership in the local FBO. The new FBO ownership has made significant efforts toward fostering aviation growth at the Airport. In fact, the FBO has expended over $10 million since 2005 in capital and facility improvements, including participation in the 2007 access roadway redevelopment project. The stated goal of these improvements by the FBO is to win more aircraft maintenance business, which in turn, will increase both local and itinerant aircraft operations (aircraft are shuttled to and from the Airport for maintenance and test flown following maintenance events).

Several forecast scenarios were developed to appropriately reflect current general aviation operational activity and provide realistic projections for the 20-year planning period. The

forecast scenarios generated for this Airport Master Plan Update assume, for the most part, straight-line growth. While it is recognized that straight-line (consistent) growth never occurs year after year for many years, average annual growth methodologies often serve to illustrate intermediate and long-range planning. It should be noted that it is not the actual numbers that are most important, but the reasoning, assumptions, and trends that the numbers represent.

The following scenarios were considered in the development of the general aviation operations forecast:

- **FAA TAF.** Data from the December 2008 FAA Terminal Area Forecast (TAF) is shown (0.65 percent)

- **Scenario One.** As indicated in this projection and according to the *FAA Aerospace Forecasts for Fiscal Years 2008-2025*, general aviation operations at towered airports nationwide are expected to increase at an average rate of 1.3 percent annually. In other words, in this scenario, the Airport would continue to maintain its national market share of general aviation operations at towered airports.

- **Scenario Two.** As previously mentioned, the socioeconomic conditions of a particular area can affect aviation activity. Typically, population, employment, and income are analyzed and used as a forecast scenario. Scenario Two utilizes the forecast average annual population growth for the Grand Junction Metropolitan Statistical Area (MSA) of 2.6 percent as a projection basis.

- **Scenario Three.** This scenario projects an average growth rate of 3.0 percent which is equal to the national forecast for general aviation hours flown from the *FAA Aerospace Forecasts for Fiscal Years 2008-2025*. Much of the projected increase reflects increased flying by business and corporate aircraft as well as a steady, if relatively small annual percentage increases in utilization rates for piston aircraft.

A comparison of these scenarios is presented in the following table entitled *GENERAL AVIATION AIRCRAFT OPERATIONS FORECAST SCENARIOS, 2007-2027*. Scenario One (maintain national market share) is the selected forecast for this planning effort. This scenario assumes that the Airport will maintain its national market share of towered airport, general aviation aircraft operations. This reflects the fact that the Airport is expected to

remain center for business aviation and aircraft maintenance with a significant number of operations conducted by turbine powered general aviation aircraft.

Table B7

GENERAL AVIATION AIRCRAFT OPERATIONS FORECAST SCENARIOS, 2007-2027

Year	FAA TAF	FAA TAF GA Ops at Towered Airports	Scenario One (1.3%)[1, 4]	Scenario One National Market Share %[5]	Scenario Two (2.6%)[1]	Scenario Three (3.0%)[1]
2007	48,832	33,616,484	65,300[2]	0.2%	65,300[2]	65,300[2]
2008	46,801	31,266,783	66,149	0.2%	66,998	67,259
2009	47,056	31,345,730	67,009	0.2%	68,740	69,277
2010	47,314	31,442,324	67,880	0.2%	70,527	71,355
2011	47,697	31,825,388	68,762	0.2%	72,361	73,496
2012	48,084	32,215,257	69,565	0.2%	74,242	75,701

Military Operations Forecast

As a percentage of total annual aircraft operations, the number of military operations at the Airport has historically been relatively low. No factors have been identified that would significantly increase the number of military operations in the future; therefore, the number of military aircraft operations is projected to remain at historic levels throughout the planning period.

Table B8

MILITARY OPERATIONS FORECAST, 2007-2027

Year	Military Operations
2007[1]	5,824
2012	5,824
2017	5,824
2022	5,824
2027	5,824

[1] *Actual.*

Operations Forecast by Aircraft Type

As indicated in the following table entitled *SUMMARY OF OPERATIONS BY AIRCRAFT TYPE, 2007-2027*, total annual operations are anticipated to increase by 31 percent (1.6 percent per year) through the planning period. Overall, operations are expected to increase from the current level of 82,745 to approximately 109,037 by the end of the planning period. General aviation aircraft operations are projected to continue to represent the majority percentage of airport activity through the planning period.

Table B9

SUMMARY OF OPERATIONS BY AIRCRAFT TYPE, 2007-2027

Operations By Type	2007 [1]	2012	2017	2022	2027
Commercial Service	*11,622*	*13,650*	*15,152*	*16,816*	*18,665*
Narrow-body	214	300	333	366	407
Regional Jet	4,376	6,050	6,716	7,455	8,274
Turbo-Prop	7,022	7,300	8,103	8,995	9,984
General Aviation[2]	*65,300*	*69,656*	*74,303*	*79,260*	*84,548*
Single Engine Piston	39,180	40,749	42,353	43,989	45,656
Multi-Engine Piston	3,265	3,483	3,715	3,963	4,227
Turbo-Prop	5,224	5,573	5,944	6,341	6,764
Business Jet	16,325	18,111	20,062	22,193	24,519

Total Operations	**82,745**	**89,130**	**95,279**	**101,900**	**109,037**

Source: *BARNARD DUNKELBERG & COMPANY.*

[1] *Actual.*

[2] *Includes non-scheduled air taxi operations.*

On an overall percentage basis, the Airport currently experiences a large number of commercial regional jet and turbo-prop operations (approximately 98 percent) when compared with commercial narrow body aircraft operations (approximately 2 percent). This is a result of the primary equipment utilized by the regional and commuter airlines that serve the Airport.

Currently, operations conducted by single engine aircraft represent approximately 60 percent of the general aviation activity, while approximately 5 percent are multi-engine piston operations, 8 percent are turbo-prop operations, 25 percent are business jet operations, and 2 percent are

helicopter operations. It is estimated that through the planning period, the distribution percentage of operations for single engine piston aircraft will decrease slightly, while the distribution percentage of business jet aircraft will increase.

Local and Itinerant Operations Forecast

The *Air Traffic Control Handbook* defines a local operation as any operation performed by an aircraft operating in the local traffic pattern or within sight of the tower, or aircraft known to be departing or arriving from flight in local practice areas, or aircraft executing practice instrument approaches at an airport. According to Grand Junction Regional Airport Authority records, itinerant operations constituted approximately 69 percent of the total operations at the Airport. This existing percentage of itinerant activity can be attributed to the fact that, with respect to general aviation, the Airport accommodates a significant number of business- and tourist-related aircraft operations and currently experiences a limited amount of general aviation flight training activity.

It is forecast that the level of itinerant aviation activity will likely remain high. As can be seen in the following table, entitled *SUMMARY OF LOCAL AND ITINERANT OPERATIONS, 2007-2027*, the role of the Grand Junction Regional Airport will remain the same. The Airport will continue to serve as a center for business and maintenance-related general aviation operations, with the forecast percentage of itinerant operational activity remaining relatively constant throughout the planning period.

Table B10

SUMMARY OF LOCAL AND ITINERANT OPERATIONS, 2007-2027

Year	Local Operations	Itinerant Operations	Total Operations
2007[1]	25,775	56,970	82,745
2012	27,764	61,366	89,130
2017	29,679	65,600	95,279
2022	31,742	70,158	101,900
2027	33,965	75,072	109,037

Source: *BARNARD DUNKELBERG & COMPANY.*

[1] *Grand Junction Regional Airport Authority.*

Peak Period Forecast

An additional element of assessing airport usage, and determining various requirements necessitated by capacity and demand considerations, is the determination of peak period activities. Historical operational data for Grand Junction Regional Airport was utilized to determine peaking characteristics. Peak months have historically been during the summer with aircraft operations exceeding 8,000 for the month. The peak period operation projections are depicted in the following table, entitled *PEAK PERIOD AIRCRAFT OPERATIONS, 2007-2027*.

Table B11

PEAK PERIOD AIRCRAFT OPERATIONS, 2007-2027

Year	Annual	Peak Month	Average Day of Peak Month	Peak Hour/ Average Day Ratio	Average Peak Hour
2007	82,745	8,275	267	10%	27
2012	89,130	8,913	288	11%	32
2017	95,279	9,528	307	12%	37
2022	101,900	10,190	329	13%	43
2027	109,037	10,904	352	14%	49

Source: *BARNARD DUNKELBERG & COMPANY.*
Operation counts were tabulated based on methodology from FAA AC 150/5070-6B Airport Master Plans and FAA AC 150/5060-5 Airport Capacity and Delay.

General Aviation Based Aircraft Forecast

The determination of the number and type of aircraft anticipated to be based at an airport is also a vital component in developing a plan for future facilities. Generally, there is a relationship between aviation activity and based aircraft, stated in terms of operations per based aircraft (OPBA). Sometimes, a trend can be established from historical information on aircraft operations and based aircraft. The national trend has been changing with more aircraft being used for business purposes and less for pleasure flying. This impacts the OPBA in that business aircraft are usually flown more often than recreational or pleasure aircraft. It is expected that the number of operations per based aircraft will increase at the Airport as more based aircraft are used for business purposes.

The based aircraft forecast scenarios are presented in the following table. Scenario One is based on the average annual growth rate of 1.3 percent for general aviation activity from the *FAA Aerospace Forecasts for Fiscal Years 2008-2025*. Scenario Two assumes that the Airport will maintain its current level of 393 general aviation OPBA. This scenario is also consistent with FAA

Order 5090.3C *National Plan of Integrated Airport Systems* which state that "a general guideline is 350 operations per based aircraft for busier general aviation airports with more itinerant traffic, and 450 operations per based aircraft for busy reliever airports." As can be seen in the table, both scenarios result in 215 based aircraft at the Airport by 2027.

Table B12

GENERAL AVIATION BASED AIRCRAFT FORECAST SCENARIOS, 2007-2027

Year	Col. State System Plan	FAA TAF	Scenario One (1.3%)	Scenario Two (393 OPBA)[3]
2007	-	204	166	166
2008	-	206	168	168
2009	-	210	170	171

[3] *Selected Forecast.*

The mix of based aircraft for incremental periods throughout the planning period is shown in the following table, entitled *GENERAL AVIATION BASED AIRCRAFT FLEET MIX, 2007-2027*. With an existing high percentage of single engine aircraft based at the Airport, the percentage of turbo prop and business jet aircraft is expected to increase as a part of the total based aircraft population. This is in line, first of all, with overall trends in general aviation, but even more importantly, parallels the economic development and growth expectations and projections characteristic of the region. By the end of the planning period, single engine aircraft are anticipated to comprise 77% of the total based aircraft at the Airport, with approximately 9% being multi-engine piston aircraft, 10% turbo-props, 3% business jets and 1% being helicopters.

Table B13

GENERAL AVIATION BASED AIRCRAFT FLEET MIX, 2007-2027

Aircraft Type	2007	2012	2017	2022	2027
Single Engine Piston	130 *(78.4%)*	138 *(78.0%)*	147 *(77.6%)*	156 *(77.2%)*	165 *(76.8%)*
Multi-Engine Piston	15 *(9.0%)*	16 *(9.0%)*	17 *(9.0%)*	18 *(9.0%)*	19 *(9.0%)*
Turbo Prop	17 *(10.2%)*	18 *(10.4%)*	19 *(10.4%)*	21 *(10.4%)*	22 *(10.4%)*
Business Jet	3 (1.8%)	4 (2.0%)	5 (2.4%)	6 (2.8%)	8 (3.2%)
Helicopter	1 *(0.6%)*	1 *(0.6%)*	1 *(0.6%)*	1 *(0.6%)*	1 *(0.6%)*
Total	**166[1]** ***(100%)***	**177** ***(100%)***	**189** ***(100%)***	**202** ***(100%)***	**215** ***(100%)***

Source: *BARNARD DUNKELBERG & COMPANY.*

[1] *Following the publication of the Draft Airport Master Plan in May 2009, the Airport conducted a thorough based aircraft count. The 2009 number of aircraft based at the Airport is 104. This is significantly lower than the 2007 estimate of 166 based aircraft; however, the implications for the recommended improvements included in this Master Plan Update are minimal. Storage facilities for additional based aircraft will not be constructed until there is sufficient demand for such facilities.*

Airport Reference Code (ARC) Analysis

The types of aircraft presently utilizing an airport and those projected to utilize the facility in the future are important considerations for planning airport facilities. An airport should be designed in accordance with the Airport Reference Code (ARC) standards that are described in AC 150/5300-13 *Airport Design*. The ARC is a coding system used to relate and compare airport design criteria to the operational and physical characteristics of the aircraft intended to operate at the airport. The ARC has two components that relate to the airport's "Design Aircraft". The first component, depicted by a letter (i.e., A, B, C, D or E), is the aircraft approach category and relates to aircraft approach speed based upon operational characteristics. The second component, depicted by a roman numeral (i.e., I, II, III, IV, V or VI), is the aircraft design group and relates to aircraft wingspan (physical characteristic). Generally speaking, aircraft approach speed applies to runways and runway-related facilities, while aircraft wingspan is primarily related to separation criteria associated with taxiways and taxilanes.

Based on an examination of the current and future operational information and existing airport plans, it has been determined that for Runway 11/29, it is appropriate to maintain an ARC of D-III [approach speeds associated with the commercial regional jet aircraft (e.g., the CRJ-200) and wingspans associated with aircraft as large as B-727-200 size aircraft]. According to DOT Bureau of Transportation Statistics data there were approximately 4,620 commercial operations conducted by CRJ-200 aircraft and 638 commercial operations conducted by the B-727-200 aircraft at the Airport in 2007.

Based on an examination of operational information for Runway 4/22 and discussions with airport personnel, a continuation of the existing ARC of B-II (small, private jet and turbo prop aircraft, e.g., Cessna Citation 550/560 size aircraft) is most appropriate. According to the FAA Airport Situation Display to Industry (ASDI) database, there were approximately 579 private operations by Citation 550/560 aircraft at the Grand Junction Regional Airport in 2007. Additional information and analysis related to the future ARC designation for Runway 4/22 is provided in the next two chapters.

Summary

The following tables summarize the forecasts of aviation activity that have been presented in this chapter. This information will be utilized in the next chapter to document and analyze both airside and landside facility requirements. Therefore, the forecasts of aviation activity are an important part of the information base which will be used to develop future plans for the Airport and formulate implementation decisions relating to airport development.

[1] *Actual.*

[2] Following the publication of the Draft Airport Master Plan in May 2009, the Airport conducted a thorough based aircraft count. The 2009 number of aircraft based at the Airport is 104. This is significantly lower than the 2007 estimate of 166 based aircraft; however, the implications for the recommended improvements included in this Master Plan Update are minimal. Storage facilities for additional based aircraft will not be constructed until there is sufficient demand for such facilities.

Capacity

C. Capacity Analysis and Facility Requirements

MASTER PLAN UPDATE

GRAND JUNCTION

REGIONAL AIRPORT

C. Capacity Analysis and Facility Requirements

The capacity of an airfield is primarily a function of the major aircraft operating surfaces that compose the facility and the configuration of those surfaces (runways and taxiways). However, it is also related to and considered in conjunction with wind coverage, airspace utilization, and the availability and type of navigational aids. Capacity refers to the number of aircraft operations that a facility can accommodate on either an hourly or yearly basis. It does not refer to the size or weight of aircraft. Facility requirements are used to determine the facilities needed to meet the forecast demand related to the existing and forecast aircraft fleet. The following evaluation analyzes runway length, dimensional criteria, aprons, hangars, and vehicular access.

Airfield Capacity Methodology

The evaluation method used to determine the capability of the airside facilities to accommodate aviation operational demand is described in the following narrative. Evaluation of this capability is expressed in terms of potential excesses and deficiencies in capacity. The methodology used for the measurement of airfield capacity in this study is described in Federal Aviation Administration (FAA) Advisory Circular 150/5060-5, *Airport Capacity and Delay*. From this methodology, airfield capacity is defined in the following terms:

- *Hourly Capacity of Runways*: The maximum number of aircraft that can be accommodated under conditions of continuous demand during a one-hour period.

- *Annual Service Volume*: A reasonable estimate of an airport's annual capacity (i.e., level of annual aircraft operations that will result in an average annual aircraft delay of approximately one to four minutes).

The capacity of an airport's airside facilities is a function of several factors. These factors include the layout of the airfield, local environmental conditions, specific characteristics of local aviation

demand, and air traffic control requirements. The relationship of these factors and their cumulative impact on airfield capacity are examined in the following paragraphs.

Airfield Layout

The arrangement and interaction of airfield components (runways, taxiways, and ramp entrances) refers to the layout or "design" of the airfield. As previously described, Grand Junction Regional Airport is served by two intersecting runways: Runway 11/29 and Runway 4/22. The primary runway, Runway 11/29, is served by a full-length parallel taxiway with seven connector taxiways, while the secondary crosswind runway, Runway 4/22, is served with a full-length parallel taxiway with five connector taxiways.

The majority of the Airport's existing landside facilities is located on the southwest side of Runway 11/29, and includes the passenger terminal facility, airport administration, operations and maintenance offices, FBO facilities, T-hangars/executive hangar facilities, apron areas, the Airport Traffic Control Tower (ATCT), and the Aircraft Rescue and Fire Fighting (ARFF) facility. These facilities are well situated to take advantage of the existing taxiway system.

Environmental Conditions

Climatological conditions specific to the location of an airport not only influence the layout of the airfield, but also affect the use of the runway system. Surface wind conditions have a direct effect on the operation of an airport; runways not oriented to take the fullest advantage of prevailing winds will restrict the capacity of an airport to varying degrees. When landing and taking off, aircraft are able to operate properly on a runway as long as the wind component perpendicular to the direction of travel (defined as a crosswind) is not excessive.

Ceiling and Visibility. FAA Advisory Circular 150/5060-5, *Airport Capacity and Delay*, describes three categories of ceiling and visibility minimums for use in both capacity and delay calculations. Visual Flight Rules (VFR) conditions occur whenever the cloud ceiling is at least 1,000 feet above ground level and the visibility is at least three statute miles. Instrument Flight Rules (IFR) conditions occur when the reported cloud ceiling is at least 500 feet, but less than 1,000 feet and/or visibility is at least one statute mile, but less than three statute miles. Poor Visibility and Ceiling (PVC) conditions exist whenever the cloud ceiling is less than 500 feet and/or the visibility is less than one statute mile.

Meteorological data from the National Climatic Data Center has been used to tabulate information at Grand Junction Regional Airport in more specific terms:

- VFR conditions - ceiling equal to or greater than 1,000 feet above ground level and visibility is equal to or greater than three statute miles. These conditions occur at the Airport approximately 94.8% of the time annually.

- VFR minimums to Grand Junction Category I ILS minimums - ceiling less than 1,000 feet and/or visibility less than three statute miles, but ceiling equal to or greater than 200 feet and visibility equal to or greater than ½-statute mile. These conditions occur at the Airport approximately 4.1% of the time annually.

- Below Category I ILS minimums - ceiling less than 200 feet and/or visibility less than ½-statute mile. These conditions occur at the Airport approximately 1.1% of the time annually.

Wind Coverage. Surface wind conditions (i.e., direction and speed) generally determine the desired alignment and configuration of the runway system. Runways, which are not oriented to take advantage of prevailing winds, will restrict the capacity of an airport. Wind conditions affect all airplanes in varying degrees; however, the ability to land and takeoff in crosswind conditions varies according to pilot proficiency and aircraft type. Generally, the smaller the aircraft, the more it is affected by crosswinds.

To determine wind velocity and direction at Grand Junction Regional Airport, wind data to construct the all weather wind rose was obtained for the years 1997-2006 from observations taken at the Airport. There were approximately 79,395 observations available for analysis during this ten-year period. The allowable crosswind component is dependent upon the Airport Reference Code (ARC) for the type of aircraft that utilize the Airport on a regular basis. As identified in the previous chapter, the current Airport Reference Code (ARC) for Runway 11/29 is ARC D-III; and for Runway 4/22, the current ARC is B-II.

In consideration of the ARC D-III classification for Runway 11/29, these standards specify that the 20-knot crosswind component be utilized for analysis. Runway 4/22 has an ARC of B-II and a 13-knot crosswind is considered maximum. In addition, it is known that the Airport will continue to serve small single and twin-engine aircraft for which the 10.5-knot and 13-knot crosswind components are considered maximum; therefore, depending on runway designation, 20-knot or 16-knot components, along with the 13-knot and 10.5-knot crosswind components,

are analyzed for Grand Junction Regional Airport. The following illustration, entitled *ALL WEATHER WIND ROSE*, illustrates the all weather wind coverage provided at Grand Junction Regional Airport. The desirable wind coverage for an airport's runway system is 95 percent. This means that the runway orientation and configuration should be developed so that the maximum crosswind component is not exceeded more than five percent of the time annually. The following table, entitled *ALL WEATHER WIND COVERAGE SUMMARY*, quantifies the wind coverage offered by the Airport's existing runway system, including the coverage for each runway end. Based on the all weather wind analysis for Grand Junction Regional Airport, utilizing the FAA Airport Design Software supplied with FAA Advisory Circular 150/5300-13, the existing runway configuration provides the following wind coverage: 99.88 percent for the 20-knot crosswind component, 99.73 percent for the 16-knot crosswind component, 99.57 percent for the 13-knot crosswind component, and 98.87 percent for the 10.5-knot crosswind component. Therefore, no additional runways are required from a *wind coverage* standpoint.

The Airport is served by an ILS precision approach to Runway 11, along with straight-in LOC, and RNAV GPS approaches to Runway 11 and LDA/DME and RNAV GPS approaches to Runway 29. To evaluate the effectiveness of these approaches, and analyze the potential benefits of implementing lower approach visibility minimums, an Instrument Flight Rules (IFR) wind rose has been constructed. The following table and illustration quantify the wind coverage offered by each runway end in consideration of typical Category I precision approach minimums [ceiling less than 1,000 feet and/or visibility less than three statute miles, but ceiling equal to or greater than 200 feet and visibility equal to or greater than ½ statute mile].

From this IFR wind coverage summary, it can be determined that Runway 29 provides the best IFR wind coverage for each crosswind component. However, from a relative perspective, each of the other three runway ends also provides good IFR coverage. The information provided by this analysis has been incorporated into the formulation of various future airside development alternatives and the ultimate development recommendations for the Airport.

Table C1

All WEATHER WIND COVERAGE SUMMARY

	Wind Coverage Provided Under All Weather Conditions			
	10.5-Knot	13-Knot	16-Knot	20-Knot
Runway 11/29	96.10%	97.70%	99.00%	99.63%

Characteristics of Demand

Certain site-specific characteristics related to aviation use and aircraft fleet mix impact the capacity of the airfield. These characteristics include aircraft mix, runway use, percent arrivals, touch-and-go operations, exit taxiways, and air traffic control rules.

Aircraft Mix. The capacity of a runway is dependent upon the type and size of the aircraft that use the facility. FAA Advisory Circular 150/5060-5, *Airport Capacity and Delay*, categorized aircraft into four classes based on maximum certificated takeoff weight. This differs from the Airport Reference Code defined previously, which classifies aircraft based on aircraft approach speed and wingspan (A-E). For aircraft weight class mix, aircraft Classes A and B consist of small single engine and twin-engine aircraft (both prop and jet), weighing 12,500 pounds or less, which are representative of the general aviation fleet. Classes C and D aircraft are larger jet and propeller aircraft typical of the business jet fleet, along with those aircraft used by the airline industry and the military. In consideration of the forecasts presented in the previous chapter, an aircraft mix has been estimated. Aircraft mix is defined as the relative percentage of operations conducted by each of these four classes of aircraft. The aircraft mix for Grand Junction Regional Airport is depicted in the following table, entitled *AIRCRAFT CLASS MIX FORECAST, 2007-2027.*

Table C3
AIRCRAFT CLASS MIX FORECAST, 2007-2027

Year	VFR Conditions Class A & B	VFR Conditions Class C	VFR Conditions Class D	IFR Conditions Class A & B	IFR Conditions Class C	IFR Conditions Class D
2007[1]	53%	47%	---	28%	72%	---
2012	54%	46%	---	28%	72%	---
2017	55%	45%	---	28%	72%	---
2022	56%	44%	---	28%	72%	---
2027	57%	43%	---	28%	72%	---

***Source**: BARNARD DUNKELBERG & COMPANY.*

Class A - Small Single Engine, < 12,500 pounds. *Class B – Small Twin-Engine, < 12,500 pounds.*
Class C - 12,500 - 300,000 pounds. *Class D - > 300,000 pounds.*
[1] Existing percentage breakdown was estimated by Barnard Dunkelberg & Company

Runway Use. The use configuration of the runway system is defined by the number, location, and orientation of the active runway(s) and relates to the distribution and frequency of aircraft operations to those facilities. Both the prevailing winds in the region and the existing runway complex at Grand Junction Regional Airport combine to dictate the utilization of the existing runway system. Runway 29 is the most utilized runway end, with an estimated 48 percent of

operations using this end. The runway use percentage of the Runway 11 end is estimated at approximately 32 percent, the Runway 22 end at approximately 14 percent, and the Runway 4 end at approximately 6 percent of total runway use.

Percent Arrivals. Runway capacity is also significantly influenced by the percentage of all operations that are arrivals. Because aircraft on final approach are typically given absolute priority over departures, higher percentages of arrivals during peak periods of operations reduce the Annual Service Volume (ASV). The operations mix occurring on the runway system at Grand Junction Regional Airport reflects a general balance of arrivals to departures. Therefore, it was assumed in the capacity calculations that arrivals equal departures during the peak period.

Touch-and-Go Operations. A touch-and-go operation refers to an aircraft maneuver in which the aircraft performs a normal landing touchdown followed by an immediate takeoff without stopping or taxiing clear of the runway. These operations are normally associated with flight training and are included in local operations figures. Touch-and-go (local) operations comprise approximately 30 percent of the general aviation operations at Grand Junction Regional Airport (according to estimates by airport personnel). This level of local touch-and-go operations is expected to remain relatively constant throughout the planning period.

Exit Taxiways. The capacity of a runway is greatly influenced by the ability of an aircraft to exit the runway as quickly and safely as possible. Therefore, the quantity and design of the exit taxiways can directly influence aircraft runway occupancy time and the capacity of the runway system. The number of exit taxiways at Grand Junction Regional Airport appears adequate for existing operations as both runways are served by at least three exit taxiways in addition to the exits at each runway end. The demand and potential for future taxiway locations will be examined as the Airport Development Plan is formulated. Airport Master Plan Study Committee members have expressed interest in holding bays and/or bypass connector taxiways at each runway end to allow aircraft to perform engine run-ups without blocking access to the runway for other aircraft.

Air Traffic Control Rules

The FAA specifies separation criteria and operational procedures for aircraft near an airport contingent upon aircraft size, availability of radar, and sequencing of operations and noise abatement procedures, both advisory and/or regulatory, which may be in effect at the airport. Typically, the impact of air traffic control on runway capacity is most influenced by aircraft separation requirements dictated by the mix of aircraft utilizing the airport. Due to the mountainous terrain in the region, which prohibits continuous radar coverage by the Denver Air Route Traffic Control Center ARTCC, the hourly capacity of the existing runway system under

IFR operating conditions is restricted. It should be noted that the FAA and the State Division of Aeronautics are investigating potential strategies to implement an improved regional radar system.

It should also be noted that the Airport has published, voluntary noise compatibility procedures (VFR only) that are designed to minimize exposure of residential areas to aircraft noise. These noise abatement procedures do not significantly impact the operational capacity of the Airport, and are used at the discretion of air traffic control and pilots in consideration of safety.

Airfield Capacity Analysis

As previously described, the determination of capacity for Grand Junction Regional Airport uses the methodology described in the FAA Advisory Circular 150/5060-5, *Airport Capacity and Delay*, along with the Airport Design Software computer program that accompanies FAA Advisory Circular 150/5300-13, *Airport Design*. Several assumptions are incorporated in these capacity calculations: arrivals equal departures, the percent of touch-and-go operations is between zero and 50 percent of total operations, there is a full-length parallel taxiway to the primary runway with ample exits and no taxiway crossing problems, there are no airspace limitations, the Airport has at least one runway equipped with an ILS and the necessary air traffic control facilities to carry out operations in a radar environment, IFR weather conditions occur roughly 5 percent of the time, and approximately 80 percent of the time the Airport is operated with the runway use configuration that produces the greatest hourly capacity.

Applying information generated from the analysis described, the optimized capacity for the Airport's runway system can be formulated in terms of the following results:

- Annual Service Volume (ASV)
- Hourly Capacity of Runways (VFR and IFR)

Based on the methodology to determine the capacity at Grand Junction Regional Airport for long-range planning purposes, the theoretical ASV has been determined to be approximately 200,000 operations, with a theoretical VFR capacity of roughly 77 operations per hour and a theoretical IFR capacity of approximately 57 operations per hour. As can be seen, the Airport's Annual Service Volume is significantly greater than the number of annual operations forecast for the end of the planning period, which is 109,037. These capacity computations provide assistance in evaluating the ability of airport facilities to accommodate forecast demand.

Ground Access Capacity

The capacity of the landside access system is a function of the maximum number of vehicles that can be accommodated by a particular ground access facility. At Grand Junction Regional Airport, this relates primarily to the access roadway system capacity, the number of vehicles that can utilize a certain roadway section in a given time period, and the passenger terminal curb capacity, which is equal to the linear length of curb required to adequately accommodate peak period passenger use.

Airport Access Roadways

The capacity of roadways providing access to the Airport is based on the *Highway Capacity Manual*, published by the Transportation Research Board, Special Report 209, 1985. It is normally preferred that a roadway operate below capacity to provide reasonable flow and minimize delay to the vehicles using it. The *Highway Capacity Manual* defines different operating conditions, known as levels-of-service. The levels-of-service are functions of the volume and composition of the traffic and the speeds attained. Six levels-of-service have been established, designated by the letters A-F, providing for best to worst service in terms of driver satisfaction. Level-of-service F defines a road operating beyond its maximum capacity; traffic is typically almost at a standstill, causing major delays to road users. Level-of-service A is defined as a road with free flow operational characteristics at average travel speeds. Vehicles on a level-of-service A roadway are completely unimpeded in their ability to maneuver within the traffic stream. A level-of-service C, represented by stable traffic flow and minimal delays, is generally the preferred level of service on a road system such as in the vicinity of Grand Junction Regional Airport. Average hourly volumes of airport service roadways of typical facilities at levels-of-service C and D are summarized in the following table, entitled *GROUND ACCESS FACILITY VOLUME*.

Table C4
GROUND ACCESS FACILITY VOLUME

Facility Type	Average Hourly Volume[1] (Vehicle/Hour/Lane)[2]
Main-access and feeder freeways (controlled access, no signalization)	1,000-1,600
Ramp to and from main-access freeways, single lane	900-1,200
Principal arterial (some cross streets, two-way traffic)	900-1,600
Main-access road (signalized intersections)	700-1,000

Source: *Highway Capacity Manual, Transportation Research Board, Special Report 209, 1994*

[1] Highway Level-of-Services C and D. [2] Passenger-Car Equivalents.

The breadth of ranges given in the previous table makes their use in defining roadway capacity analysis useful, primarily in initial testing for problems. The focus of the access roadway capacity assessment for an airport is on the service provided between the terminal curb or parking area and the interchange linking the Airport with the regional transportation system. Thus, the analysis for Grand Junction Regional Airport is focused on the terminal loop roadway system consisting of Walter Walker Boulevard, Falcon Way and H Road.

The information presented in the previous table would indicate that the existing terminal roadway system has a capacity in the neighborhood of 1,200-2,400 vehicles per hour, at a level-of-service in the C to D range. It appears that the recently reconstructed airport access road system has adequate capacity to accommodate forecasted passenger traffic through the planning period. However, this analysis does not take into consideration the arrangement of other facilities along the roadway (i.e., rental car storage, etc.). It also does not take into consideration landside access to other aviation development areas on the Airport. The development plan prepared with the Airport Master Plan Update will focus on providing a comprehensive program for the airport's access roadway system, including the passenger terminal and the general aviation development areas. However, the proposal will be more influenced by "qualitative" issues related to efficiency and security, rather than by a "quantitative" analysis that focuses on the number of automobiles that can be accommodated.

Capacity Summary

This section has analyzed the capacity of existing facilities at Grand Junction Regional Airport. Both adequate airfield and ground access facilities are critical components in the ability of the Airport, as a whole, to efficiently serve the public. Capacity deficiencies, which cause delays associated within one area, will often be reflected in the ability or inability of the entire facility to function properly.

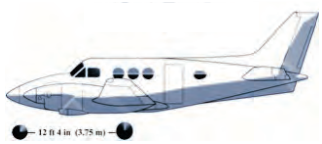
The following facility requirements section will delineate the various facilities required to accommodate future demand properly. The facility requirements information, in addition to the capacity analysis, will provide the basis for formulating the alternative development scenarios for the Airport, ensuring that the new recommended development plan can adequately accommodate the long-term aviation development requirements of the region.

Airfield Facility Requirements

In order to identify future demand at the Airport, for those facilities required to serve future needs adequately, it is necessary to translate the forecast aviation activity into specific types and quantities. This section addresses the actual physical facilities and/or improvements to existing facilities needed to safely and efficiently accommodate the projected demand that will be placed on the Airport. This section consists of two separate analyses: those requirements dealing with *airfield* facilities, and those dealing with *landside* facilities. The analysis of airfield requirements focuses on the determination of needed facilities and spatial considerations related to the actual operation of aircraft on the Airport. This evaluation includes the delineation of airfield dimensional criteria, the establishment of design parameters for the runway and taxiway system, and an identification of airfield instrumentation and lighting needs.

Dimensional Criteria

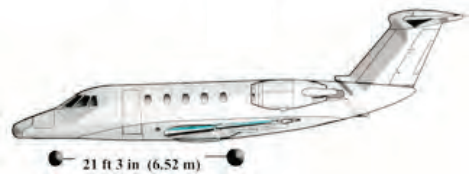
The types of aircraft that currently operate at Grand Junction Regional Airport, and those that are projected to utilize the facility in the future, have an impact on the planning and design of airport facilities. This knowledge assists in the selection of FAA specified design standards for the Airport, which include runway/taxiway dimensional requirements; runway length; and, runway, taxiway, and apron strength. These standards are based on the "Design Aircraft" that currently utilize the Airport, or that are projected to utilize the Airport in the future. According to FAA Advisory Circular 150/5300-13, *Airport Design*, the first step in defining an airport's design geometry is to determine its Airport Reference Code (ARC).



Runway 11/29 – Primary Runway. Runway 11/29 accommodates much of the small aircraft traffic at the Airport, and almost all of the large aircraft (aircraft weighing more than 12,500 pounds) traffic. As identified in the previous chapter, the ARC for Runway 11/29 is D-III based on the combination of the Bombardier CRJ-200 and the Boeing 727-200. The future "Design Aircraft" identified in previous planning documents for the Airport (Boeing 757) is recommended as the future "Design Aircraft" for this purpose of the Airport Master Plan Update. This aircraft is heavily utilized by air cargo operators who may consider initiating service into Grand Junction, based on the air cargo forecasts included in the previous chapter; and, this designation will allow both the airlines and the air cargo operators flexibility with what equipment will best serve the Grand Junction market. Grand Junction Regional Airport also serves as a diversion destination for airlines and protecting for ARC D-IV airport design standards will allow the Airport to continue to serve that role. As stated previously, the ARC designation for the Boeing 757 is D-IV. Furthermore, Runway 11/29 is also utilized by the US Military for training operations with aircraft having approach speeds of 141 knots or more (Approach Category D) and wingspans of more than 118 feet (Design Group IV).

Runway 4/22 – Crosswind Runway. This runway is used primarily by smaller general aviation aircraft. As identified in the previous chapter, the existing ARC for Runway 4/22 is B-II based on the Cessna Citation 550/560. The future "Design Aircraft" identified in previous planning documents is a combination of the CRJ-700 (Approach Category C) and the Bombardier Dash-8 (Design Group III). This combination of commercial service aircraft has been previously recommended as the future "Design Aircraft" for Runway 4/22 to allow the runway to serve the air carriers at the Airport during an extended closure of Runway 11/29 for reconstruction.

In the analysis of development alternatives, consideration will be given to upgrading the ARC for Runway 4/22 to C-III. The dimensional criteria illustrated in the following tables, entitled *ARC D-III AND D-IV DIMENSIONAL STANDARDS FOR RUNWAY 11/29 (in feet)* and *ARC B-II AND C-III DIMENSIONAL STANDARDS FOR RUNWAY 4/22 (in feet)*, are those required for the specified ARC for each runway, in conjunction with specified approach visibility minimums, and include the existing dimension for the corresponding facility. As indicated in the tables, Runway 11/29 meets or exceeds most identified requirements. There are some design standard criteria that Runway 11/29 does not meet related to longitudinal and transverse gradients and the Runway Visibility Zone (RVZ). These non-standard conditions are described further in following sections. Runway 4/22 meets or exceeds all identified existing requirements, but will require substantial improvements to upgrade the runway to ARC C-III in the future.



ARC A-I
Single-Engine Aircraft - 2 to 6 Seats
Beech Bonanza
deHaviland DHC-2 Beaver
Cessna-150

ARC B-I
Twin-Piston Aircraft - 4 to 10 Seats
Beech King Air B100
Piper 31-310 Navajo
Beech Baron 58

ARC B-I
Very Light Jet/Small Cabin 4-6 Seats
Eclipse 500
Citation Mustang
Adam Aircraft A700

ARC B-II
Twin-Turboprop/Business Jet/Small Cabin Aircraft
6 to 12 Seats - *Includes most commercial turboprop aircraft.*
Cessna Citation II/III/VII
Dassault Falcon 50
Dassault Falcon 900

ARC C/D-II
Commercial/Business Jet - 6 to 70 Seats
Bombardier CRJ-700
Bombardier CL-600 Challenger
Embraer ERJ-145

ARC C/D-III
Large Commercial/Business Jet - 14 to 110 Seats
Boeing 727-200
Bombardier BD-700 Global Express
Boeing 757 (C-IV)
McDonnell Douglas (MD-83)

Modifications to Standards

The Airport has a number of FAA approved Modifications to Standards as shown in the following table entitled *MODIFICATIONS TO STANDARDS*. By approving the modifications, the FAA has determined that an acceptable level of safety is provided, however, these modifications were intended to be temporary and options to correct these non-standard conditions will be presented in the alternatives analysis in the following chapter.

Table C7
MODIFICATIONS TO STANDARDS

Description	ARC	Existing Conditions	FAA Approval Date	FAA Airspace Case Number
Runway 11/29 Transverse Gradient	D-III	Transverse Gradient Exceeds Recommended Design Standard of 1.5%	June, 23, 2008	08-ANM-289-NRA
Runway 11/29 Longitudinal Gradient	D-III	Longitudinal Gradient Exceeds Recommended Design Standard of 1.5%	March 22, 1995	94-DEN-161-NRA
Runway 11/29 Connecting Taxiway Longitudinal Gradient	D-III	Connecting Taxiway Longitudinal Gradient Exceeds Recommended Design Standard of 0.8%	March 22, 1995	94-DEN-161-NRA
Runway 11/29 and Runway 4/22 Runway Visibility Zone (RVZ)	D-III	Many Structures obstruct Line of Sight. Runway 04/22 will be closed after ATCT normal hours of operation	March 2002	02-DEN-044-NRA

Runways

In consideration of the forecasts of future aviation activity, the adequacy of the runway system must be analyzed from several perspectives. These include runway orientation and airfield capacity, which were analyzed in the previous section, as well as runway length, pavement strength and runway line-of-sight, which will be evaluated in the following text. The analysis of these various aspects pertaining to the runway system will provide a basis for recommendations of future improvements.

Runway Line-of-Sight and Runway Visibility Zone (RVZ). The runway line-of-sight criteria for runways with full length parallel taxiways are met for both runways, however, the Runway Visibility Zone (RVZ) criteria are not met.

Runway Pavement Strength. The runway pavement strength for Runway 11/29 is adequate for the 20-year planning period, assuming routine pavement maintenance is performed. Consideration should be given to increasing the pavement strength of Runway 4/22 in accordance with the maximum takeoff weight future "Design Aircraft" for this runway if changed from the existing.

Runway Length. The determination of runway length requirements for Grand Junction Regional Airport is based on several factors. These factors include:

- Airport elevation;
- Mean maximum daily temperature of the hottest month;
- Runway gradient;
- Design aircraft type expected to use the Airport; and,
- Stage length of the longest nonstop trip destination.

The runway length requirements at the Airport are provided in the following table entitled *RUNWAY LENGTH REQUIREMENTS*. The data indicates that Runway 11/29 can accommodate 100 percent of the small aircraft fleet weighing less than 60,000 pounds and can also accommodate the majority of the commercial passenger fleet (over 60,000 pounds) on stage lengths of up to 1,500 miles. Previous planning documents have developed runway length requirements for the Airport specific to the Boeing 727-200 operated by FedEx. Because FedEx typically operates in the early morning and evening hours, the average daily temperature used in the analysis was 78.9 degrees Fahrenheit. The runway length requirement for this aircraft was determined to be 10,400 feet.

Table C8
RUNWAY LENGTH REQUIREMENTS

Runway Requirement	Runway Takeoff Length (Feet)
Existing Conditions	
Runway 11/29	*10,501*
Runway 4/22	*5,501*
Airplanes less than 12,500 lbs. with less than 10 seats	
75% of Small Aircraft Fleet	4,570
95% of Small Aircraft Fleet	6,080
100% of Small Aircraft Fleet	6,290
Airplanes less than 12,500 lbs. with 10 or more seats	6,290
Airplanes greater than 12,500 lbs. and less than 60,000 pounds	
75% of fleet at 60% useful load	6,950
75% of fleet at 90% useful load	8,880
100% of fleet at 60% useful load	11,250
100% of fleet at 90% useful load	11,280
Airplanes greater than 60,000 pounds	
500/1,000/1,500 NM stage lengths	6,720/7,970/9,130

***Source**: FAA Advisory Circular 150/5300-13, Airport Design.*
Lengths based on 4,858' AMSL, 92.1° F NMT, length of haul 500 miles, and a maximum difference in runway centerline elevation of 28'.
***Note:** Wet and Dry runway takeoff lengths are the same.*

Based on the runway length data presented, it was determined that the existing runway length of 10,501 feet is adequate to accommodate the projected aircraft operational requirements at the Airport and should be preserved. Mesa Airlines and SkyWest Airlines both include Runway 4/22 in there operational specifications on file with the Airport as a crosswind runway for turboprop and regional jet aircraft operations. Based on this occasional use by the airlines as well as the potential for airline use of this runway during an extended closure of Runway 11/29, consideration should be given to extending Runway 4/22 to a length that accommodates at least 75 percent of this aircraft fleet at 60 percent useful load, i.e. an extension to 7,000 feet.

Taxiways. Taxiways are constructed primarily to enable the movement of aircraft between the various functional areas on the Airport and the runway system. Some taxiways are necessary

simply to provide access between aircraft parking aprons and runways, whereas other taxiways become necessary to provide more efficient and safer use of the airfield.

Runway 11/29 is served by a full parallel taxiway, Taxiway A, located on the southwest side of the runway, and has eight exit/connector taxiways (Runway 4/22 also serves as a connector taxiway to this runway). Runway 4/22 is also served by a full parallel taxiway, Taxiway C, which is located on the northwest side of the runway, and has six exit/connector taxiways (Runway 11/29 and Taxiway A also serves as a connector taxiway to this runway). Both taxiways provide access to aircraft parking and various general aviation and commercial facilities on the Airport. Access to the general aviation hangar area is also provided by Taxiway C1A. As the development plan is formulated, consideration should be given to the provision of holding bays and/or bypass connector taxiways at each runway end to allow aircraft to perform engine run-ups without blocking access to the runway.

Aircraft Maintenance Run-Up Apron. The existing aircraft maintenance run-up apron is not sized properly for the aircraft need to use this apron and consideration should be given to expanding or relocating the run-up apron.

Electronic Landing Aids. Electronic landing aids, including instrument approach capabilities and associated equipment, airport lighting, and weather/airspace services, were detailed in the *Inventory* chapter of this study. The Airport is currently equipped with an ILS instrument approach to Runway 11 and has published GPS instrument approaches to Runways 11 and 29. There is also a published LOC/DME approach to Runway 11 and a LDA/DME approach to Runway 29.

Visual Landing Aids (lights). Presently, the primary runway, Runway 11/29, has a High Intensity Runway Lighting system (HIRL) and Taxiway A is equipped with a High Intensity Taxiway Lighting system (HITL). The approach end of Runway 11 is equipped with a Medium intensity Approach Lighting System with Runway alignment indicator lights (MALSR). The crosswind runway, Runway 4/22, has a Medium Intensity Runway Lighting system (MIRL) and Taxiway C is equipped with a Medium Intensity Taxiway Lighting system (MITL). Runway ends 11, 29, and 4 are all equipped with 4-Light Precision Approach Path Indicators (PAPI). Runway ends 29, 4, and 22 are equipped with Runway End Identifier Lights (REIL). In conjunction with the examination of improved instrument approaches, improved airport lighting will also need to be evaluated. The type of airport lighting will be dependent on the type of instrument approach capabilities and is examined in the next chapter of this report.

Runway Protection Zones (RPZs). The function of the RPZ is to enhance the protection of people and property on the ground beyond the runway ends. This is usually achieved through airport

control of the RPZ areas. The RPZ is trapezoidal in shape and centered about the extended runway centerline. It begins 200 feet beyond the end of the area usable for takeoff or landing. The RPZ dimensions are functions of the type of aircraft operating at the Airport and the approach visibility minimums associated with each runway end.

In consideration of the existing instrument approach minimums and the type of aircraft each runway is designed to accommodate, the following table, entitled *REQUIRED RUNWAY PROTECTION ZONE DIMENSIONS*, lists existing RPZ dimensional requirements, along with the requirements for improved approach capabilities.

Table C9
REQUIRED RUNWAY PROTECTION ZONE DIMENSIONS

Item	Width at Runway End (feet)	Length (feet)	Width at Outer End (feet)	Airport Controls Entire RPZ
Existing RPZ Dimensional Requirements:				
Runway 11	1,000	1,750	2,500	yes
Runway 29	1,000	1,750	2.500	yes
Runway 4	500	700	1,000	yes
Runway 22	500	700	1,000	yes
Required RPZ Dimensions for Various Visibility Minimums:				
Visual and not lower than 1-mile, Small Aircraft Only	250	450	1,000	---
Visual and not lower than 1-mile, Approach Categories A & B	500	700	1,000	---
Visual and not lower than 1-mile, Approach Categories C & D	500	1,010	1,700	---
Not lower than 3/4-mile, all aircraft	1,000	1,510	1,700	---
Lower than 3/4-mile, all aircraft	1,000	1,750	2,500	---

Source: *FAA Advisory Circular 150/5300-13, Airport Design.*
--- Not applicable.

Landside Facility Requirements

Landside facilities are those facilities, which support the airside facilities, but are not actually a part of the aircraft operating surfaces. These consist of such facilities as terminal buildings, hangars, aprons, access roads and support facilities. Following a detailed analysis of these

facilities, current deficiencies can be noted in terms of accommodating both existing and future aviation needs at the Airport.

Passenger Terminal Area Requirements

Components of the passenger terminal complex include the terminal building, gate/parking positions, apron area, vehicular access, and auto parking. The 70,000- square foot terminal building was constructed in 1982 and includes airline ticketing facilities, as well as passenger and baggage screening facilities. With the implementation of increased security screening facility requirements and staff, the terminal building has lost some functionality; however, modifications have been made to accommodate new security requirements. The terminal building also includes rental car counters and offices, a restaurant, a gift shop, TSA offices and airport administration offices. A satellite expansion of the terminal building was recently competed adding two jet bridges to the four second level gates serving commercial aircraft.

Passenger terminal space requirements for areas including airline counter and ticket office, ticket lobby, waiting lobby, baggage claim, departure lounge, rental car counter and office, food/beverage, concessionaires, and restrooms were quantified in previous planning studies for the Grand Junction Regional Airport. The existing available space for these areas is estimated at approximately 40,000 square feet. The previous planning studies indicated that this gross terminal area would be adequate up to approximately 350,000 annual enplanements. FAA AC 150/5360-13 Planning and Design Guidelines for Airport Terminal Facilities includes a "rule-of-thumb" methodology for estimating gross terminal building area requirement. The rule-of-thumb states that 0.08 to 0.12 square feet per annual enplanement is adequate at airports with over 250,000 enplanements. The forecasts in the previous chapter indicated that enplanements at the Airport are anticipated to exceed 370,000 by the end of the planning period.

Furthermore, based on the anticipated 2008 level of enplanements, the Airport will likely exceed 60 percent of terminal capacity for the previously mentioned areas. It is recommended that these terminal space requirements along with increased security space requirements be analyzed by area in greater detail to determine the specific areas with potential space deficiencies.

General Aviation Requirements

Aircraft based at Grand Junction Regional Airport are stored in various hangar and apron areas; however, the primary aircraft storage area is located north of Runway 4/22 along Taxilane C1A. Currently, an estimated 166 aircraft are based at the Airport; 135 stored in hangars and 31 stored on tiedowns at various apron areas. Over the course of the 20-year planning period, the number of based aircraft is forecast to increase to 215, indicating that an increase in storage facilities to accommodate approximately 49 new aircraft will be required. It is assumed that

future storage spaces will reflect some of the characteristics of current storage patterns, with the majority of the based aircraft fleet being stored in hangars.

Tiedown Storage Requirements/Based Aircraft. Aircraft tiedowns are provided for those aircraft that do not require, or do not desire, to pay the cost for hangar storage. Space calculations for these areas are based on 360 square yards of apron for each aircraft to be tied down. This amount of space allows for aircraft parking and circulation between the rows of parked aircraft. Past trends indicate that as more aircraft are based at the Airport, hangar storage capacity is surpassed before additional hangars are supplied. This indicates that increased tiedown space for based aircraft should be included in the development plan.

Tiedown Storage Requirements/Itinerant Aircraft. In addition to the needs of the based aircraft tiedown areas addressed in the preceding section, transient aircraft also require apron parking areas at Grand Junction Regional Airport. This storage is provided in the form of transient aircraft tiedown space. In calculating the area requirements for these tiedowns, typically, an area of 400 square yards per aircraft is used. The development plan for the Airport will designate adequate areas for apron development to satisfy this demand. Also, it is important to note that the itinerant aircraft apron is currently sized properly; however, the pavement strength is not adequate for the large business jet aircraft using the apron. Consideration should be given to increasing the pavement strength to accommodate these aircraft. Consideration should also be given to a rehabilitation project for those areas of the aircraft parking apron with severe Alkali-Silica Reaction (ASR) pavement cracking.

The accompanying table shows the type of facilities and the number of units or square yards needed for that facility in order to meet the forecast demand for each development phase. It is expected that most of the owners of aircraft that will be newly based at the Airport will desire some type of indoor storage facility. The actual type of hangar storage facility to accommodate based aircraft has been identified as T-hangars and larger corporate and/or executive type hangars; although, the actual number, size, and location of these hangars will depend on user needs and financial feasibility.

Access and perimeter roadway locations, auto parking requirements, and land requirements are not included in this tabulation because the amount of land necessary for these facilities will be a function of the location of other facilities, as well as the most effective routing of roadways. The following table, entitled *GENERAL AVIATION FACILITY REQUIREMENTS, 2007-2027,* depicts the quantity of storage facilities required for general aviation landside facilities during all stages of development. This will assist in the development of detailed facility staging discussed later. Again, it is assumed that the majority of aircraft owners will desire indoor storage. This

assumption leads to the conclusion illustrated in the following table that increased area for the construction of hangars will be critical and that the demand for additional aircraft parking apron will increase, but will not likely exceed the amount that is presently in place.

Table C10
GENERAL AVIATION FACILITY REQUIREMENTS, 2007-2027

		Total Number Required			
Facility	**2007 [1]**	**2012**	**2017**	**2022**	**2027**
Itinerant/GA Apron (square yards)	--	23,282	24,833	26,479	28,228
Based Aircraft GA Apron (square yards)	--	9,900	9,900	10,200	10,200
Total Apron (square yards) [2]	55,600	33,182	34,733	36,679	38,428
Itinerant Aircraft Tie Downs	--	64	68	73	78
Based Aircraft Tie Downs	--	33	33	34	34
Total Aircraft Tie Downs [2]	125	97	101	107	112
Hangar Space					
Number of Aircraft in T-Hangars	117	125	135	144	153
Number of Aircraft in Exec./Corp. Hangars	18	20	23	25	28
Total Aircraft in Hangars	135	145	158	169	181

Support Facilities Requirements

In addition to the aviation and airport access facilities described previously, there are several airport support facilities, which have quantifiable requirements and which are vital to the efficient and safe operation of the Airport. The support facilities at Grand Junction Regional Airport that require further evaluation include the aircraft rescue and firefighting facility, the fuel storage facility, and the Airport Traffic Control Tower (ATCT).

Aircraft Rescue and Firefighting Facility (ARFF). As identified in the *Inventory* chapter of this document, Index B ARFF facilities and equipment are provided at the Airport as required to serve the existing type and number of air carrier and commuter aircraft operations. The specified FAR Part 139 certification ARFF equipment and staff requirements are based on the length of the largest air carrier or commuter aircraft that serves the Airport with an average of five or more daily departures. The following table, entitled *REPRESENTATIVE AIR CARRIER/COMMUTER AIRCRAFT LENGTHS & ARFF INDEX*, presents the existing commercial aircraft fleet that currently

serve the Airport, along with their respective lengths and ARFF Index. In consideration of the commercial service operations forecast, the Airport will likely be classified as an ARFF Index B throughout the planning period.

Table C11
REPRESENTATIVE AIR CARRIER/COMMUTER AIRCRAFT LENGTHS AND ARFF INDEX

Jet Aircraft	Length (in Feet)	ARFF Index
MD-80	147.8	C
B727-200	153.2	C
CRJ-700	106.7	B
CRJ-200	87.8	A
ERJ 145	98.0	B
Turbo Prop Aircraft	**Length (in Feet)**	**ARFF Index**
Dash 8-200	80.7	A
Dash 8-Q400	107.6	B
EMB 120 Brasilia	64.8	A

Sources: FAR Part 139 *Certification and Operations: Land Airports Serving CAB-Certificated Scheduled Air Carriers Operating Large Aircraft (Other Than Helicopters).*
FAA AC 150/5300-13 *Airport Design.*

Fuel Storage Facility. Fuel storage and sales at Grand Junction Regional Airport are conducted by West Star Aviation. Available aircraft fuel storage includes 68,000 gallons of Jet-A and 32,000 gallons of 100LL AVGAS. There is also a self-serve fuel system located northeast of the Aero GJT T-Hangars. This self-service facility provides only 100LL AVGAS and is operated by Aero-Fuel. The fuel storage requirements of the Airport are variable based upon individual supplier and distributor policies, as well as military refueling contracts. For this reason, future fuel storage requirements will be dependent upon the individual distributors and space should be reserved for the expansion of existing fuel storage facilities as required.

Airport Traffic Control Tower Location Analysis. At a towered airport, the ATCT is the facility that supervises, directs, and monitors the arrival and departure traffic including the immediate airspace surrounding the airport (i.e., within approximately five miles). The tower at Grand Junction Regional Airport is currently located southeast of the terminal building and is accessed via Eagle Drive. The cab height of the tower is approximately 4,910 feet MSL at the window sill and controllers report poor line of sight into the hangar development area accessed by Taxiway

C1A. Past discussions have indicated the need to raise the cab height or relocate the ATCT to better accommodate the line of sight requirements.

A location analysis will be included in the development alternatives portion of this Airport Master Plan Update based on an analysis of TERPS criteria, FAR Part 77 criteria, sight distances and shadowing effects, and physical considerations such as infrastructure development, access, topography and general location factors, and facility construction costs (using information obtained from FAA ANM-510 or other FAA sources). It should be noted that an FAA study will be required before the location, height, and size of the ATCT can be accurately established.

Summary

The information provided in this chapter provides the basis for understanding what facility improvements at the Airport might help in the effort to accommodate future demands in an efficient and safe manner. Following are the major development issues and improvement considerations that are indicated in the *Capacity Analysis and Facility Requirements* chapter:

- Maintenance and rehabilitation of Runway 11/29.
- Correction of non-standard longitudinal and transverse gradients on Runway 11/29 and its associated connector taxiways.
- Correction of the non-standard Runway Visibility Zone (RVZ).
- The potential extension, parallel taxiway relocation, ARC upgrade and instrument approach improvements for Runway 4/22 to accommodate air carrier operations during the anticipated closure and reconstruction of Runway 11/29.
- The continuation of efforts to acquire additional land north and east of the Airport for potential future aviation use.
- Future relocation and siting of the Airport Traffic Control Tower.
- Vehicular access to various airport development area, including areas northeast of Runway 11/29 and southeast of Runway 4/22.
- Areas programmed for future general aviation development in consideration of existing structures.
- Areas programmed for future air cargo development in consideration of the projected increase in air cargo activity at the Airport.
- Areas programmed for future non-aviation related development.

- Instrument approach capabilities of both runways.
- Off-airport land use compatibility and zoning.

It is important to note that the recommendations in this Master Plan Update are provided to best understand what facilities improvements might be needed at the Airport, and where those facilities might be best placed. In other words, the Master Plan Update provides recommendations on how various parcels of the Airport might be best developed, in consideration of potential demand and community/environmental influences. One of the basic assumptions, typically included in a master plan for a complex facility like an airport, is that if a future improvement is identified on the recommended development plan; it will only be built if there is actual demand, if the project is financially feasible, and if environment impacts are insignificant or can be adequately mitigated.

Table C12

FACILITY REQUIREMENTS SUMMARY, 2007-2027

Facility	2007[1]	2012	2017	2022	2027
Dimensional Standards					
Runway 11/29	D-III	D-III	D-III	D-IV	D-IV
Runway 4/22[2]	B-II	C-III[4]	C-III[4]	C-III[4]	C-III[4]
Runway Length/Width					
Runway 11/29	10,501′ x 150′	10,501′ x 150′	10,501′ x 150′	10,501′ x 150′	10,501′ x 150′
Runway 4/22[2]	5,501′ x 75′	7,000′ x 100′	7,000′ x 100′	7,000′ x 100′	7,000′ x 100′
Instrument Approach Enhancement					
Runway 11/29	<½ Mile/1 Mile	<½ Mile/½ Mile	<½ Mile/½ Mile	<½ Mile/½ Mile	<½ Mile/½ Mile
Runway 4/22[3]	Visual/Visual	¾ Mile/¾ Mile	¾ Mile/¾ Mile	¾ Mile/¾ Mile	¾ Mile/¾ Mile
General Aviation Apron and Hangar Requirements					
Total Apron (square yards)	55,600	33,182	34,733	36,679	38,428
Total Aircraft Tie Downs	125	97	101	107	112
T-Hangar Spaces	117	125	135	144	153
Exec./Corp. Hangar Spaces	18	20	23	25	28

D. Development Concepts and Alternatives Analysis

MASTER PLAN UPDATE

GRAND JUNCTION

REGIONAL AIRPORT

D. Development Concepts and Alternatives Analysis

The purpose of this chapter is to present development alternatives and development recommendations for Grand Junction Regional Airport in terms of concepts and reasoning. This chapter provides a description of the various factors and influences, which will form the basis for the Airport's long-term development program.

In concert with the role of the Airport, and community input received in the planning process, several basic assumptions have been established that are intended to direct the development of the Airport in the future.

Assumption One. The Airport will be developed and operated in a manner that is consistent with local ordinances and codes, federal and state statutes, federal grant assurances, and Federal Aviation Administration (FAA) regulations.

Assumption Two. This assumption recognizes the role of the Airport. The Airport will continue to serve as a facility that accommodates commercial passenger service activity, along with general aviation activity and a small amount of military activity.

Assumption Three. This assumption relates to the size and type of aircraft that utilize the Airport and the resulting setback and safety criteria used as the basis for the layout of associated airport facilities.

Runway 11/29. As it has been in previous planning studies, the "Design Aircraft" for this runway is a combination of aircraft, specifically the Bombardier CRJ-200 and the Boeing 727-200. The CRJ-200 has an approach speed of 142 knots and the B-727/200 has a wingspan of 108 feet. This indicates that the Airport Reference Code (ARC) for Runway 11/29 is D-III. In accordance with future plans of air cargo carriers serving the Airport, the future "Design Aircraft" for this runway has been identified as the Boeing 757-300 with an approach speed of 143 knots and a wingspan of 124.8 feet. This indicates that the future ARC for Runway 11/29 is D-IV.

Runway 4/22. Past planning studies have identified this runway as one that mostly accommodates small- to medium-size general aviation aircraft (up to and including many of the business jets), along with the smaller turbo-prop commercial passenger service aircraft. The historic "Design Aircraft" fleet for this runway has been made up of turbo-props such as the Beech Super King Air 200, the Cessna Citation, the Beech 1900, etc. This indicates that this runway should be designed using ARC B-II dimensional criteria. Should Runway 4/22 be required to serve as the "air carrier" runway during maintenance and rehabilitation of Runway 11/29, an ARC upgrade may be required.

Assumption Four. The fourth assumption relates to the need for the Airport to accommodate aircraft operations with great reliability and safety. This indicates that the Airport's runway system should be developed with instrument approach guidance capabilities, to accommodate the forecast operations as safely as possible under most weather conditions.

Assumption Five. Because the amount of landside development area at any airport is at a premium, the fifth assumption is that the plan for future airport development should strive to make most efficient use of the available area for aviation-related activities, including general aviation facilities and passenger terminal facilities. Aviation use areas should be developed to be compatible with surrounding land uses.

Assumption Six. The sixth assumption focuses on the relationship of the Airport to off-airport land uses and the compatible and complementary development of each. To the maximum extent possible, future facilities will be designed to enhance the compatibility of the operation of the Airport with the environs.

Assumption Seven. This assumption recognizes the on-going discussion concerning the location and operation of the ATCT. Alternative sites should be identified for future ATCT facilities in consideration of the airside and landside development recommendations.

Goals and Objectives for Development

Accompanying these assumptions are several goals and objectives, which have been established for purposes of directing the plan and establishing continuity in the future development of the Airport. These goals and objectives take into account several categorical considerations relating to the needs of the Airport, both in the short-term and the long-term, including safety, noise, capital improvements, land use compatibility, financial and economic conditions, public interest and investment, and community recognition and awareness. While all are project-oriented,

some obviously represent more tangible activities than others; however, all are deemed important and appropriate to the future of the Airport.

The following goals and objectives are intended to guide the preparation of this Airport Master Plan Update and direct the future expansion of Grand Junction Regional Airport:

- Provide effective direction for the future development of Grand Junction Regional Airport through the preparation of a rational, reasonable, and implementable plan.
- Prepare a plan that allows the Airport to fulfill its mission to facilitate and enhance regional aviation services.
- Accommodate the forecast aviation activity levels in a safe and efficient manner by providing the necessary airport facilities and services.
- Ensure that the future development of the Airport will accommodate a variety of general aviation activities, ranging from small general aviation users to corporate aviation operators.
- Plan and develop the Airport to be capable of accommodating the future needs and requirements of the City of Grand Junction, Mesa County, and the larger surrounding service area and supporting regional economic development activity.
- Plan for potential property acquisition for approach protection and land use compatibility purposes.
- Encourage and protect the public and private investment in land and facilities.

Airside Development Concepts and Alternatives

Introduction

Because all other airport functions relate to and revolve around the basic runway/taxiway layout, airside development alternatives must first be carefully examined and evaluated. It is essential that the initial development recommendations for the Airport be commensurate with the anticipated needs and requirements of airport users; however, the long-term expansion of the facility must also be considered and planned for to ensure the capability to accommodate potential activity levels. The main objective of the planning recommendations presented herein is to identify future development that will result in a runway/taxiway system capable of accommodating the forecast aviation activity. The recommendations are described in the following text and in the illustration at the end of this chapter, entitled *CONCEPTUAL DEVELOPMENT PLAN*.

Following a review of these airside development alternatives, the purpose of which is to fulfill *major* facility requirements (basic runway configuration), recommendations for landside development are presented. For purposes of this study, landside facilities consist of aircraft parking aprons, hangar development areas, terminal area development, and airport access. Following review of the alternatives by the Study Committee, airport staff, other interested parties and the FAA, a conclusion for this chapter will be formulated that includes a generalized conceptual airport development plan, recommendations for runway and taxiway improvements, along with an on-airport land use plan.

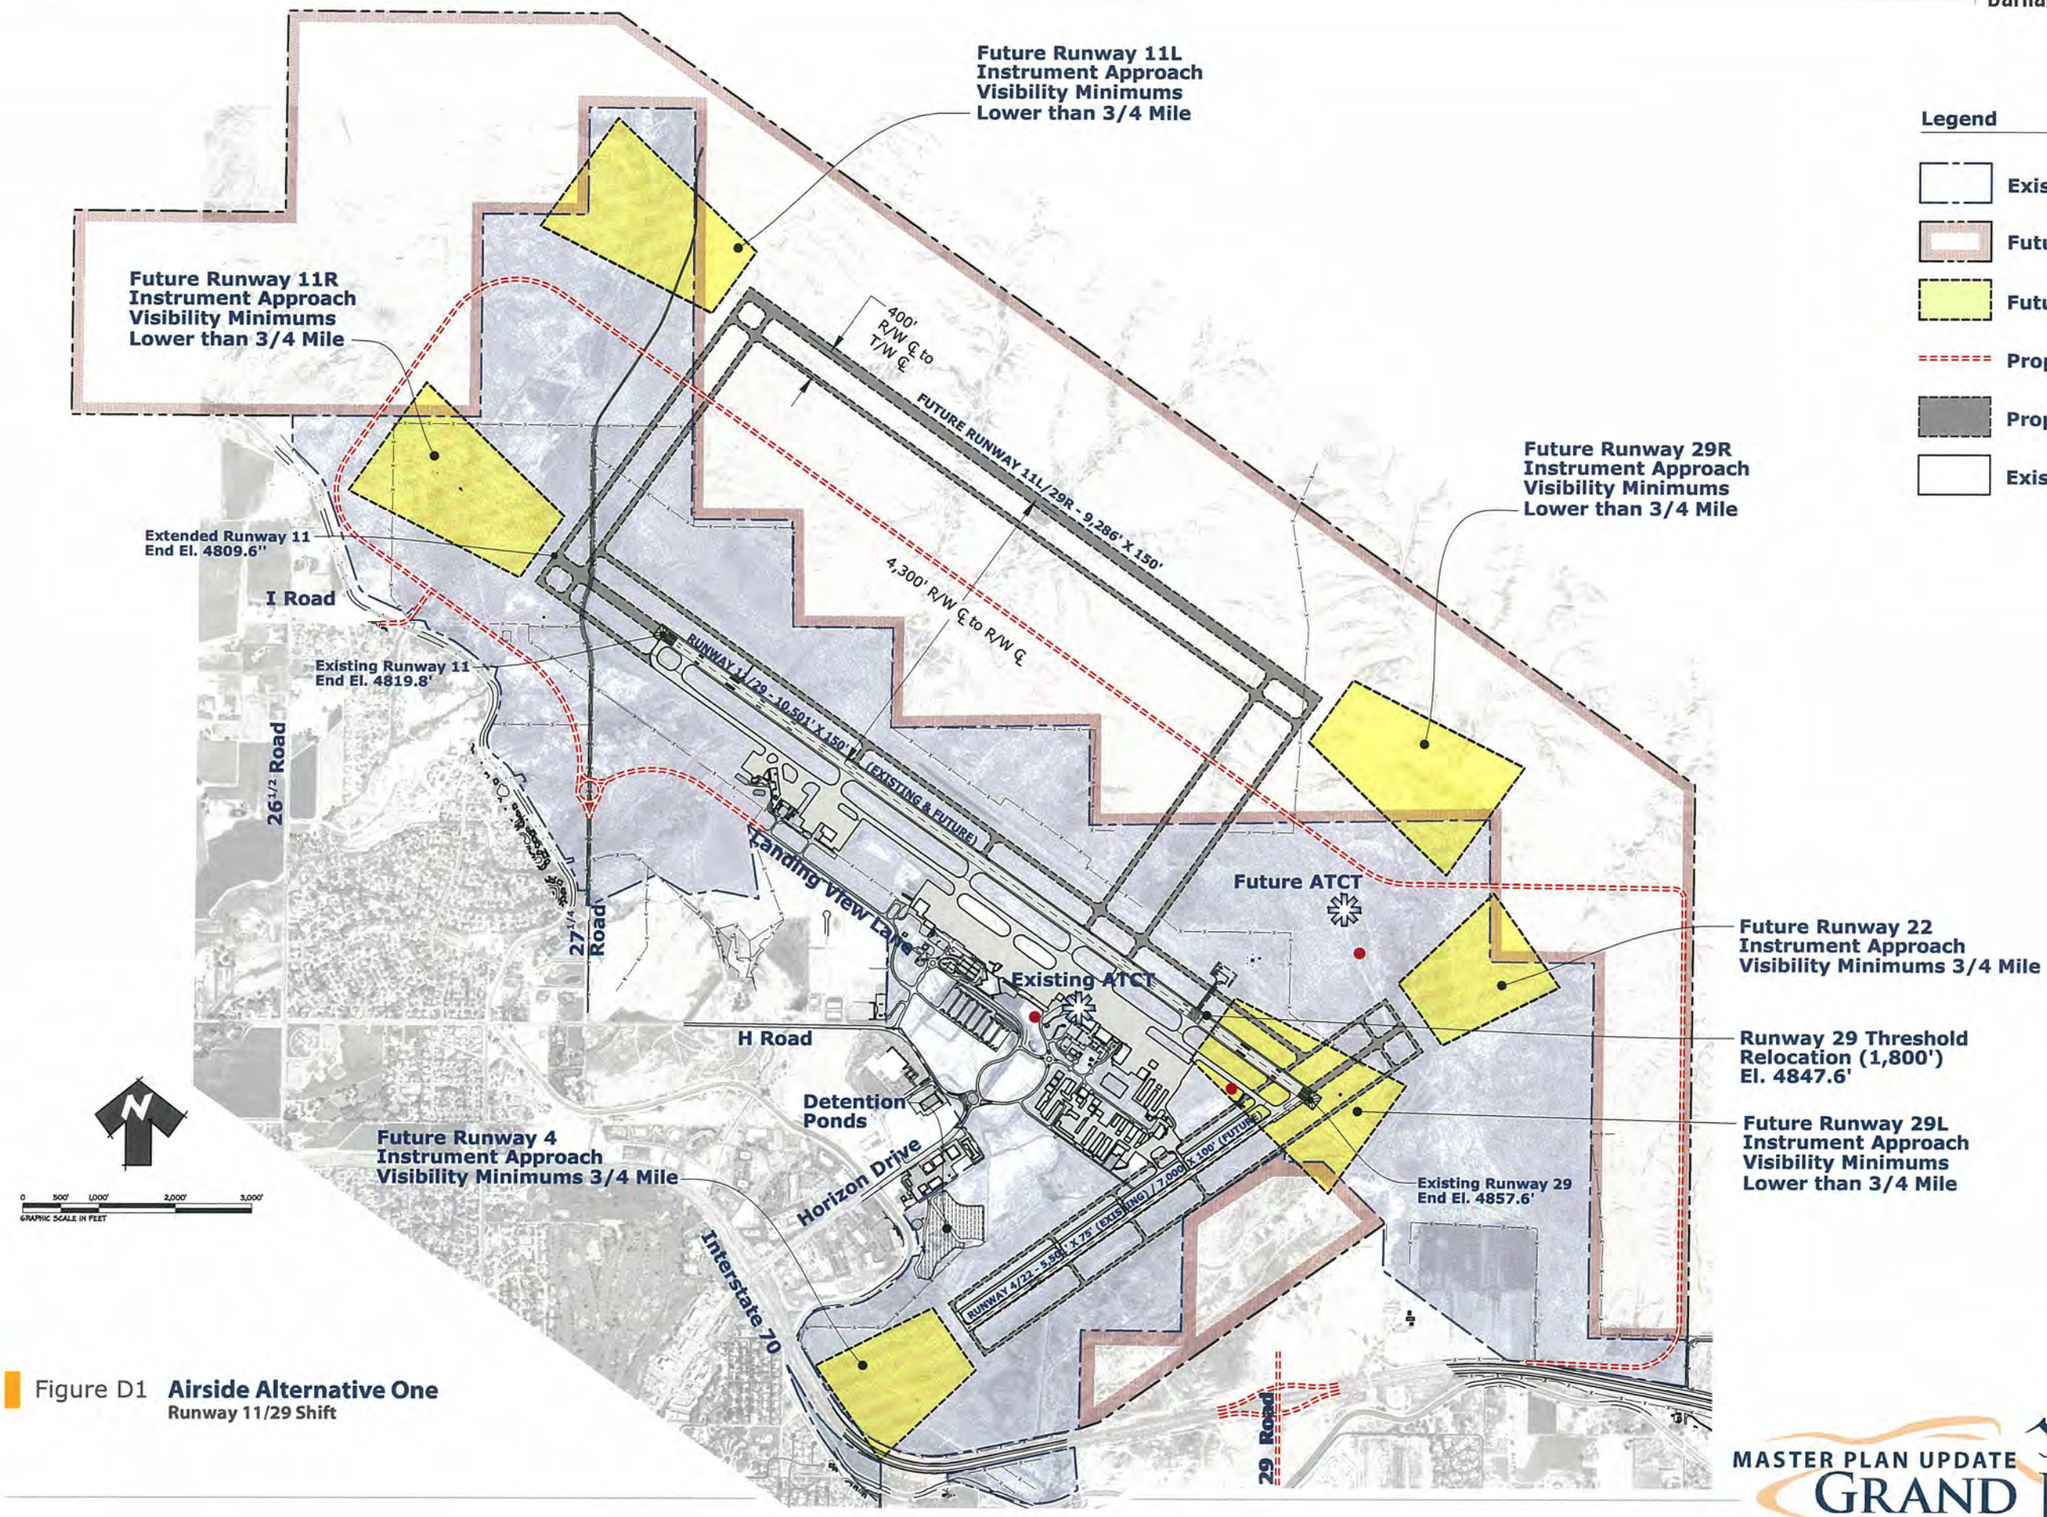
Airside Alternative One

As explained in the previous chapter, the runway length requirements of those aircraft using the Airport on a regular basis are met with the existing length of Runway 11/29 and it is recommended that this runway length be maintained. The primary purpose of Alternative One is to correct the existing non-standard conditions associated with the excessive longitudinal and transverse gradients on Runway 11/29 and to resolve the non-standard condition associated with the crossing runways and the resulting Runway Visibility Zone (RVZ) penetrations.

Shift Runway 11/29

- The Airport's main runway (Runway 11/29) will be shifted approximately 1,800 feet to the northwest (1,800 feet of additional pavement is added to the approach end of Runway 11 and 1,800 feet of pavement is removed/decommissioned at the approach end of Runway 29).
- Runway 11/29 is completely reconstructed and all longitudinal and transverse gradients are corrected to meet FAA design standards (estimated construction time frame is eight to ten months).
- Runway 4/22 is upgraded to ARC C-III standards including a widening of the runway to 150 feet, an extension of the runway to 7,000 feet, and a flattening of the runway to meet Category C gradient standards (allows the runway to be utilized by the air carriers during reconstruction/shifting of Runway 11/29).
- Runway 11/29 instrument approach visibility minimums will be programmed to remain at less than ¾-mile.
- Runway 4/22 instrument approach visibility minimums will be programmed for as low as ¾-mile.
- Parallel Taxiway "A" will be extended in accordance with the 1,800-foot shift of Runway 11/29.

- Parallel Taxiway "C" will be relocated to a C-III runway/taxiway separation of 400 feet.
- Additional parallel taxiways on opposite sides of each runway are protected for.
- A future parallel runway (Runway11L/29R), as shown on historical plans for the Airport, is protected for at a standard runway/runway separation (4,300 feet) to allow for the potential of simultaneous IFR approaches.
- A north side airport access road, connecting the future 29 Road interchange with I-70 and both I Road, and 27 ¼ Road is planned to provide vehicular access to potential north side aviation-related development including the potential relocated ATCT.



Positive Qualities of Alternative One

- Increases safety by correcting the RVZ without having to relocate the landside facilities that penetrate the RVZ. Correction of the RVZ will also increase the utility of the Airport by allowing Runway 4/22 to remain open during evening hours when the ATCT is closed.
- Increases safety by correcting the non-standard longitudinal and transverse gradients associated with Runway 11/29.
- In consideration of other alternatives, Alternative One will minimize new construction and capital improvement costs.
- Maintains the operational capability of the Airport to serve the air carriers and cargo carriers during reconstruction of Runway 11/29.
- Allows for the expansion of the existing aircraft maintenance run-up area northeast of Taxiway "A7".

Negative Qualities of Alternative One

- This alternative would correct all of the existing non-standard conditions with the notable exception of the longitudinal gradient on the connector taxiways between Runway 11/29 and Taxiway "A".
- Requires a significant amount of embankment off the approach end of Runway 11 to accommodate the runway shift.

- Requires the relocation of 27 ¼ Road around the shifted RPZ to the approach end of Runway 11.
- Requires a significant investment to upgrade and extend Runway 4/22. It is likely that the cost/benefit of this investment is very low as the upgraded runway will serve large turbo-prop and regional jet aircraft for only an eight- to ten-month period during reconstruction of Runway 11/29.
- The extension of the approach end of Runway 22 will require excavation of rising terrain and may require additional excavation to the northeast to meet Threshold Siting Surface (TSS) requirements. This rising terrain may also prevent the implementation of approach visibility minimums as low as ¾-mile to this runway end.
- Requiring air carrier and cargo aircraft to depart via Runway 22 would add additional air traffic and noise over residential areas off the departure end of Runway 22. These same aircraft would also overfly noise sensitive land uses on approach to Runway 4.

Figure D1 **Airside Alternative One**
Runway 11/29 Shift

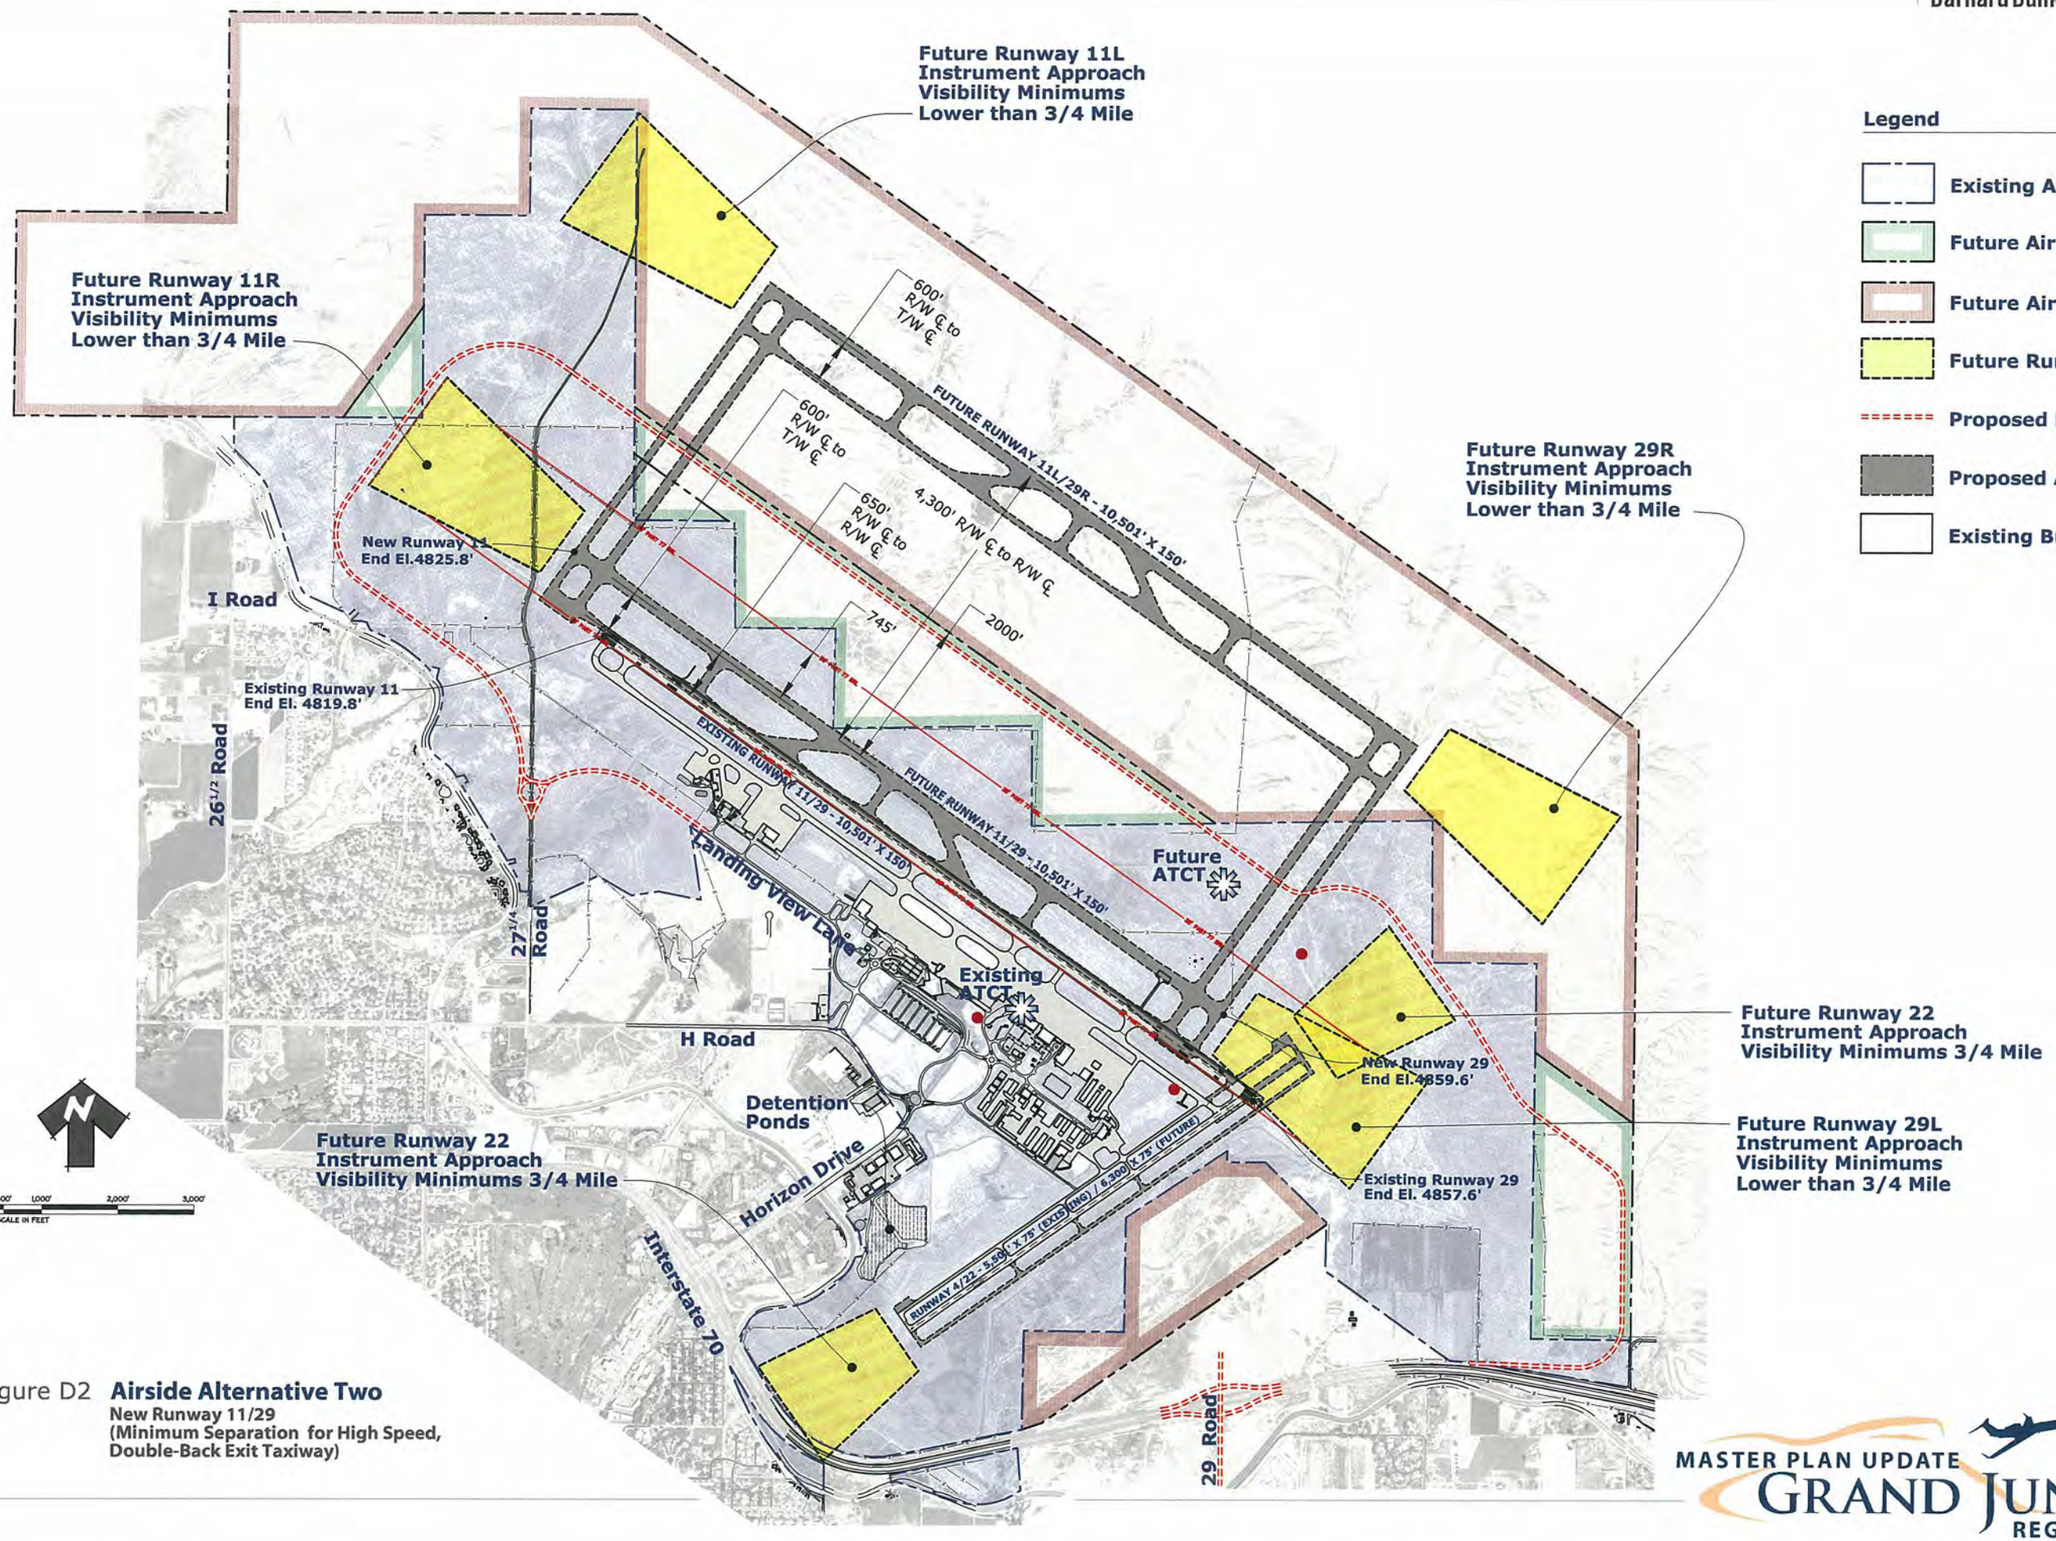
Airside Alternative Two

As in Alternative One, the primary purpose of Alternative Two is to correct the existing non-standard conditions associated with the excessive longitudinal and transverse gradients on Runway 11/29 and the penetrations of the Runway Visibility Zone (RVZ) between the two runways. The secondary purpose of Alternative Two is to also correct the non-standard taxiway longitudinal gradients associated with a number of the connector taxiways between Runway 11/29 and parallel Taxiway "A" and also correct the positioning of the runway "crown" or the lateral runway high point, which is currently located 25 feet from the northeasterly edge of the runway. While technically not a non-standard condition, it is generally accepted engineering practice to design a runway with the "crown" centered in the middle of the runway. The non-centered runway "crown" is likely the result of multiple runway widening projects that placed the additional runway pavement on only one side of the runway, rather than an equal placement of additional pavement on both sides of the runway.

New Runway 11/29 (Minimum Separation)

- The Airport's main runway (Runway 11/29) will be laterally relocated 650 feet to the northeast and longitudinally relocated 1,000 feet to the northwest.
- The new Runway 11/29 will be designed and constructed to meet all FAA design standards in accordance with the current and planned ARC for this runway.
- Runway 4/22 will be maintained to its existing B-II design standards; however, an extension of the approach end of Runway 22 providing a total length of 6,300 feet will be protected for. This is considered the ultimate runway length requirement for this runway, assuming it is not needed to serve the air carriers, and, this extension will accommodate 100 percent of the small aircraft fleet (aircraft less than 12,500 pounds). In this alternative, Runway 4/22 will ***not*** need to be upgraded to ARC C-III standards.
- Aircraft run-up areas/holding bays are programmed for all four runway ends and bypass taxiways are programmed for each end of Runway 11/29.
- Runway 11/29 instrument approach visibility minimums will be programmed at less than ¾-mile.
- Runway 4/22 instrument approach visibility minimums will be programmed for as low as ¾-mile.
- Parallel Taxiway "A" will be relocated to the "crown" of the existing Runway 11/29 (600-foot separation from the new Runway 11/29).

- Parallel Taxiway "C" will be maintained in its current location.
- Additional parallel taxiways on opposite sides of each runway are protected for.
- A future parallel runway (Runway11L/29R), as shown on historical plans for the Airport, is protected for at a standard runway/runway separation (4,300 feet) to allow for the potential of simultaneous IFR approaches.
- A north side airport access road, connecting the future 29 Road interchange with I-70 and both I Road and 27 ¼ Road, is planned to provide vehicular access to potential north side aviation-related development including the potential relocated ATCT.



Positive Qualities of Alternative Two

- The existing Runway 11/29 will remain operational during construction of the new Runway 11/29, and, the operational capability of the Airport to fully serve the air carriers and cargo carriers will not be diminished.
- Does not require an ARC upgrade of Runway 4/22.
- Increases safety by correcting the RVZ without having to relocate the landside facilities that penetrate the RVZ. Correction of the RVZ will also increase the utility of the Airport by allowing Runway 4/22 to remain open during evening hours when the ATCT is closed.
- Increases safety by correcting the non-standard longitudinal and transverse gradients associated with Runway 11/29.
- Allows for the correction of the non-standard longitudinal gradients on the connector taxiways between Runway 11/29 and the relocated Taxiway "A".
- Increases safety by correcting the non-centered runway "crown".
- Increases the hourly capacity of the runway system by allowing for the construction of high speed exit taxiways with reverse double-back curves.

Negative Qualities of Alternative Two

- Does not minimize construction and capital improvement costs.
- Requires the relocation of 27 ¼ Road around the shifted RPZ to the approach end of Runway 11.

- The extension of the approach end of Runway 22 will require excavation of rising terrain and may require additional excavation to the northeast to meeting Threshold Siting Surface (TSS) requirements. This rising terrain may also prevent the implementation of approach visibility minimums as low as ¾-mile to this runway end.
- Requires the relocation of the existing aircraft maintenance run-up area northeast of Taxiway "A7".
- Would result in FAR Part 77 imaginary surface penetrations during construction of the new Runway 11/29, and will require construction and phasing solutions to maintain the operational capability of existing Runway 11/29 during construction of the new runway.

Figure D2 **Airside Alternative Two**
New Runway 11/29
(Minimum Separation for High Speed, Double-Back Exit Taxiway)

Airside Alternative Three

As in Alternative Two, the primary purpose of Alternative Three is to correct the existing non-standard conditions associated with the excessive longitudinal and transverse gradients on Runway 11/29 and the penetrations of the Runway Visibility Zone (RVZ) between the two runways. The secondary purpose of Alternative Three is to also correct the non-standard taxiway gradients associated with a number of the connector taxiways between Runway 11/29 and parallel Taxiway "A" and also correct the positioning of the runway "crown". One further objective of Alternative Three is to allow construction equipment associated with the new Runway 11/29 to entirely avoid penetrating the FAR Part 77 imaginary surfaces associated with existing Runway 11/29 during the phased construction period.

New Runway 11/29 (Maximum Separation)

- The Airport's main runway (Runway 11/29) will be laterally relocated 938 feet to the northeast and longitudinally relocated 500 feet to the northwest. The purpose of the 938-foot relocation is to allow for construction equipment (up to 20 feet tall) to operate within the entire runway safety area (RSA) surrounding the new Runway 11/29 without penetrating the FAR Part 77 transitional surface of the existing Runway 11/29.
- The new Runway 11/29 will be designed and constructed to meet all FAA design standards in accordance with the current and planned ARC for this runway.
- Runway 4/22 will be maintained at its existing length and width and will ***not*** need to be upgraded to ARC C-III standards.
- Aircraft run-up areas/holding bays are programmed for all four runway ends and bypass taxiways are programmed for each end of Runway 11/29.
- Runway 11/29 instrument approach visibility minimums will be programmed at less than ¾-mile.
- Runway 4/22 instrument approach visibility minimums will be programmed for as low as ¾-mile.
- Parallel Taxiway "A" will be relocated to the "crown" of the existing Runway 11/29 (888-foot separation from the new Runway 11/29).
- Parallel Taxiway "C" will be maintained in its current location.
- Additional parallel taxiways on opposite sides of each runway are protected for.

- A future parallel runway (Runway11L/29R), as shown on historical plans for the Airport, is protected for at a standard runway/runway separation (4,300 feet) to allow for the potential of simultaneous IFR approaches.
- A north side airport access road, connecting the future 29 Road interchange with I-70 and both I Road and 27 ¼ Road, is planned to provide vehicular access to potential north side aviation-related development, including the potential relocated ATCT.

Positive Qualities of Alternative Three

- The existing Runway 11/29 will remain operational during construction of the new Runway 11/29, and, the operational capability of the Airport to fully serve the air carriers and cargo carriers will not be diminished.
- Allows for construction of the new Runway 11/29 without FAR Part 77 transitional surface penetrations by construction equipment.
- Increases safety by correcting the RVZ without having to relocate the landside facilities that penetrate the RVZ. Correction of the RVZ will also increase the utility of the Airport by allowing Runway 4/22 to remain open during evening hours when the ATCT is closed.
- Increases safety by correcting the non-standard longitudinal and transverse gradients associated with Runway 11/29.
- Allows for the correction of the non-standard longitudinal gradients on the connector taxiways between Runway 11/29 and the relocated Taxiway "A".
- Increases safety by correcting the non-centered runway "crown".
- Increases the hourly capacity of the runway system by allowing for the construction of high speed exit taxiways with reverse double-back curves.
- Does not require any BLM land for the RPZ to the approach end of the relocated Runway 11.

Negative Qualities of Alternative Three

- Alternative Three has the highest construction costs of the three alternatives, primarily due to the amount of excavation required to construct the new runway 938 feet from the existing runway.
- The siting of the new Runway 11/29 in Alternative Three would likely restrict any future extension of the approach end of Runway 22.

- Requires the relocation of 27 ¼ Road around the shifted RPZ to the approach end of Runway 11.
- Requires the relocation of the existing aircraft maintenance run-up area northeast of Taxiway "A7".
- Would significantly increase the runway/taxiway separation of the primary runway system. Aircraft would be required to taxi greater distances to access landside facilities, resulting in an increase in ground taxi fuel burns and aircraft emissions.

Conclusions and Recommended Alternative

Several conclusions can be reached with regard to the future airfield components that should be recommended as part of this Airport Master Plan Update. The conclusions that appear to be appropriate at this preliminary stage include:

- The Airport's main runway (Runway 11/29) should be relocated at the minimum allowable separation (Airside Alternative Two) for construction phasing in order to correct all non-standard conditions associated with this runway and its connector taxiways. Additional benefits of this new runway include the correction of the non-standard RVZ, the correction of the non-centered runway "crown", and the elimination of the need to upgrade the crosswind runway (Runway 4/22).
- A two-phase land acquisition of BLM land can be programmed with the first phase required for the relocated Runway 11/29, the future ATCT, and the future north side access road. The second phase BLM land transfer could include the land required for the ultimate parallel runway (Runway 11L/29R).
- Aircraft engine run-up areas/holding bays should be provided at each runway end possibly combined with a maintenance related engine run-up area.
- A potential extension of the approach end of Runway 22 should be protected for in the siting of the new Runway 11/29.
- Future instrument approach minimums lower than ¾-mile for Runway 11/29 and as low as ¾-mile for Runway 4/22 should be protected for to the greatest extent practicable.

New Runway 11/29
(Maximum Separation with no Part 77 Transitional Surface Penetrations by 20' Construction Equipment

Landside Development Concepts

Introduction

With the basic framework of the Airport's ultimate airside development identified, the placement of landside facilities can now be analyzed. In general, landside facilities consist of terminal area development, aircraft parking aprons, support facility development, hangar development areas, and airport access. The overall objective of landside development planning at the Airport is the provision of facilities that are conveniently located and accessible to the community, and that accommodate the specific requirements of airport users.

The current landside development area at Grand Junction Regional Airport is located south of Runway 11/29 and west of Runway 4/22. This area is very close to full build out, with only three locations left for development including the area adjacent to connector Taxiways A1 and A2, the "infill" area between connector Taxiways A3 and A4, and the area south of Navigators Way. The preferred airside alternative (Alternative Two) shifts Runway 11/29 approximately 650 feet to the north and east, which will create additional landside developable area for both aircraft parking apron and aviation facilities expansion. This is a significant benefit to the Airport because, once the previously mentioned landside areas are developed, the Airport will likely need to look at concepts for landside development north and east of Runway 11/29. The area north and east of Runway 11/29 currently has almost no landside access or infrastructure necessary for development and the extensions to properly serve the area will be very costly.

Illustrations of the landside area created by Airside Alternative Two have been prepared to graphically depict the potential acreage available for both aviation-related development and apron/tie down expansion. Also, in consideration of the forecasts of enplanements and air carrier operations, as well as the evolving security requirements and airline business practices, passenger terminal facilities at the Airport will require significant modification, renovation, and expansion. An envelope for potential passenger terminal redevelopment has also been identified.

Following input from stakeholders, airport staff, the FAA, and the public on major landside elements, more detailed factors will be addressed. The detailed factors include such items as roadway access, automobile parking, fuel storage facilities, conceptual layout of future hangars, fencing and gates, aircraft parking aprons, utilities, etc. The following illustrations, entitled *LANDSIDE FACILITIES CONCEPTUAL LAYOUT WEST* and *LANDSIDE FACILITIES CONCEPTUAL LAYOUT EAST*, provide an idea of the areas that can be reserved for landside facilities in consideration of the preferred airside alternative.

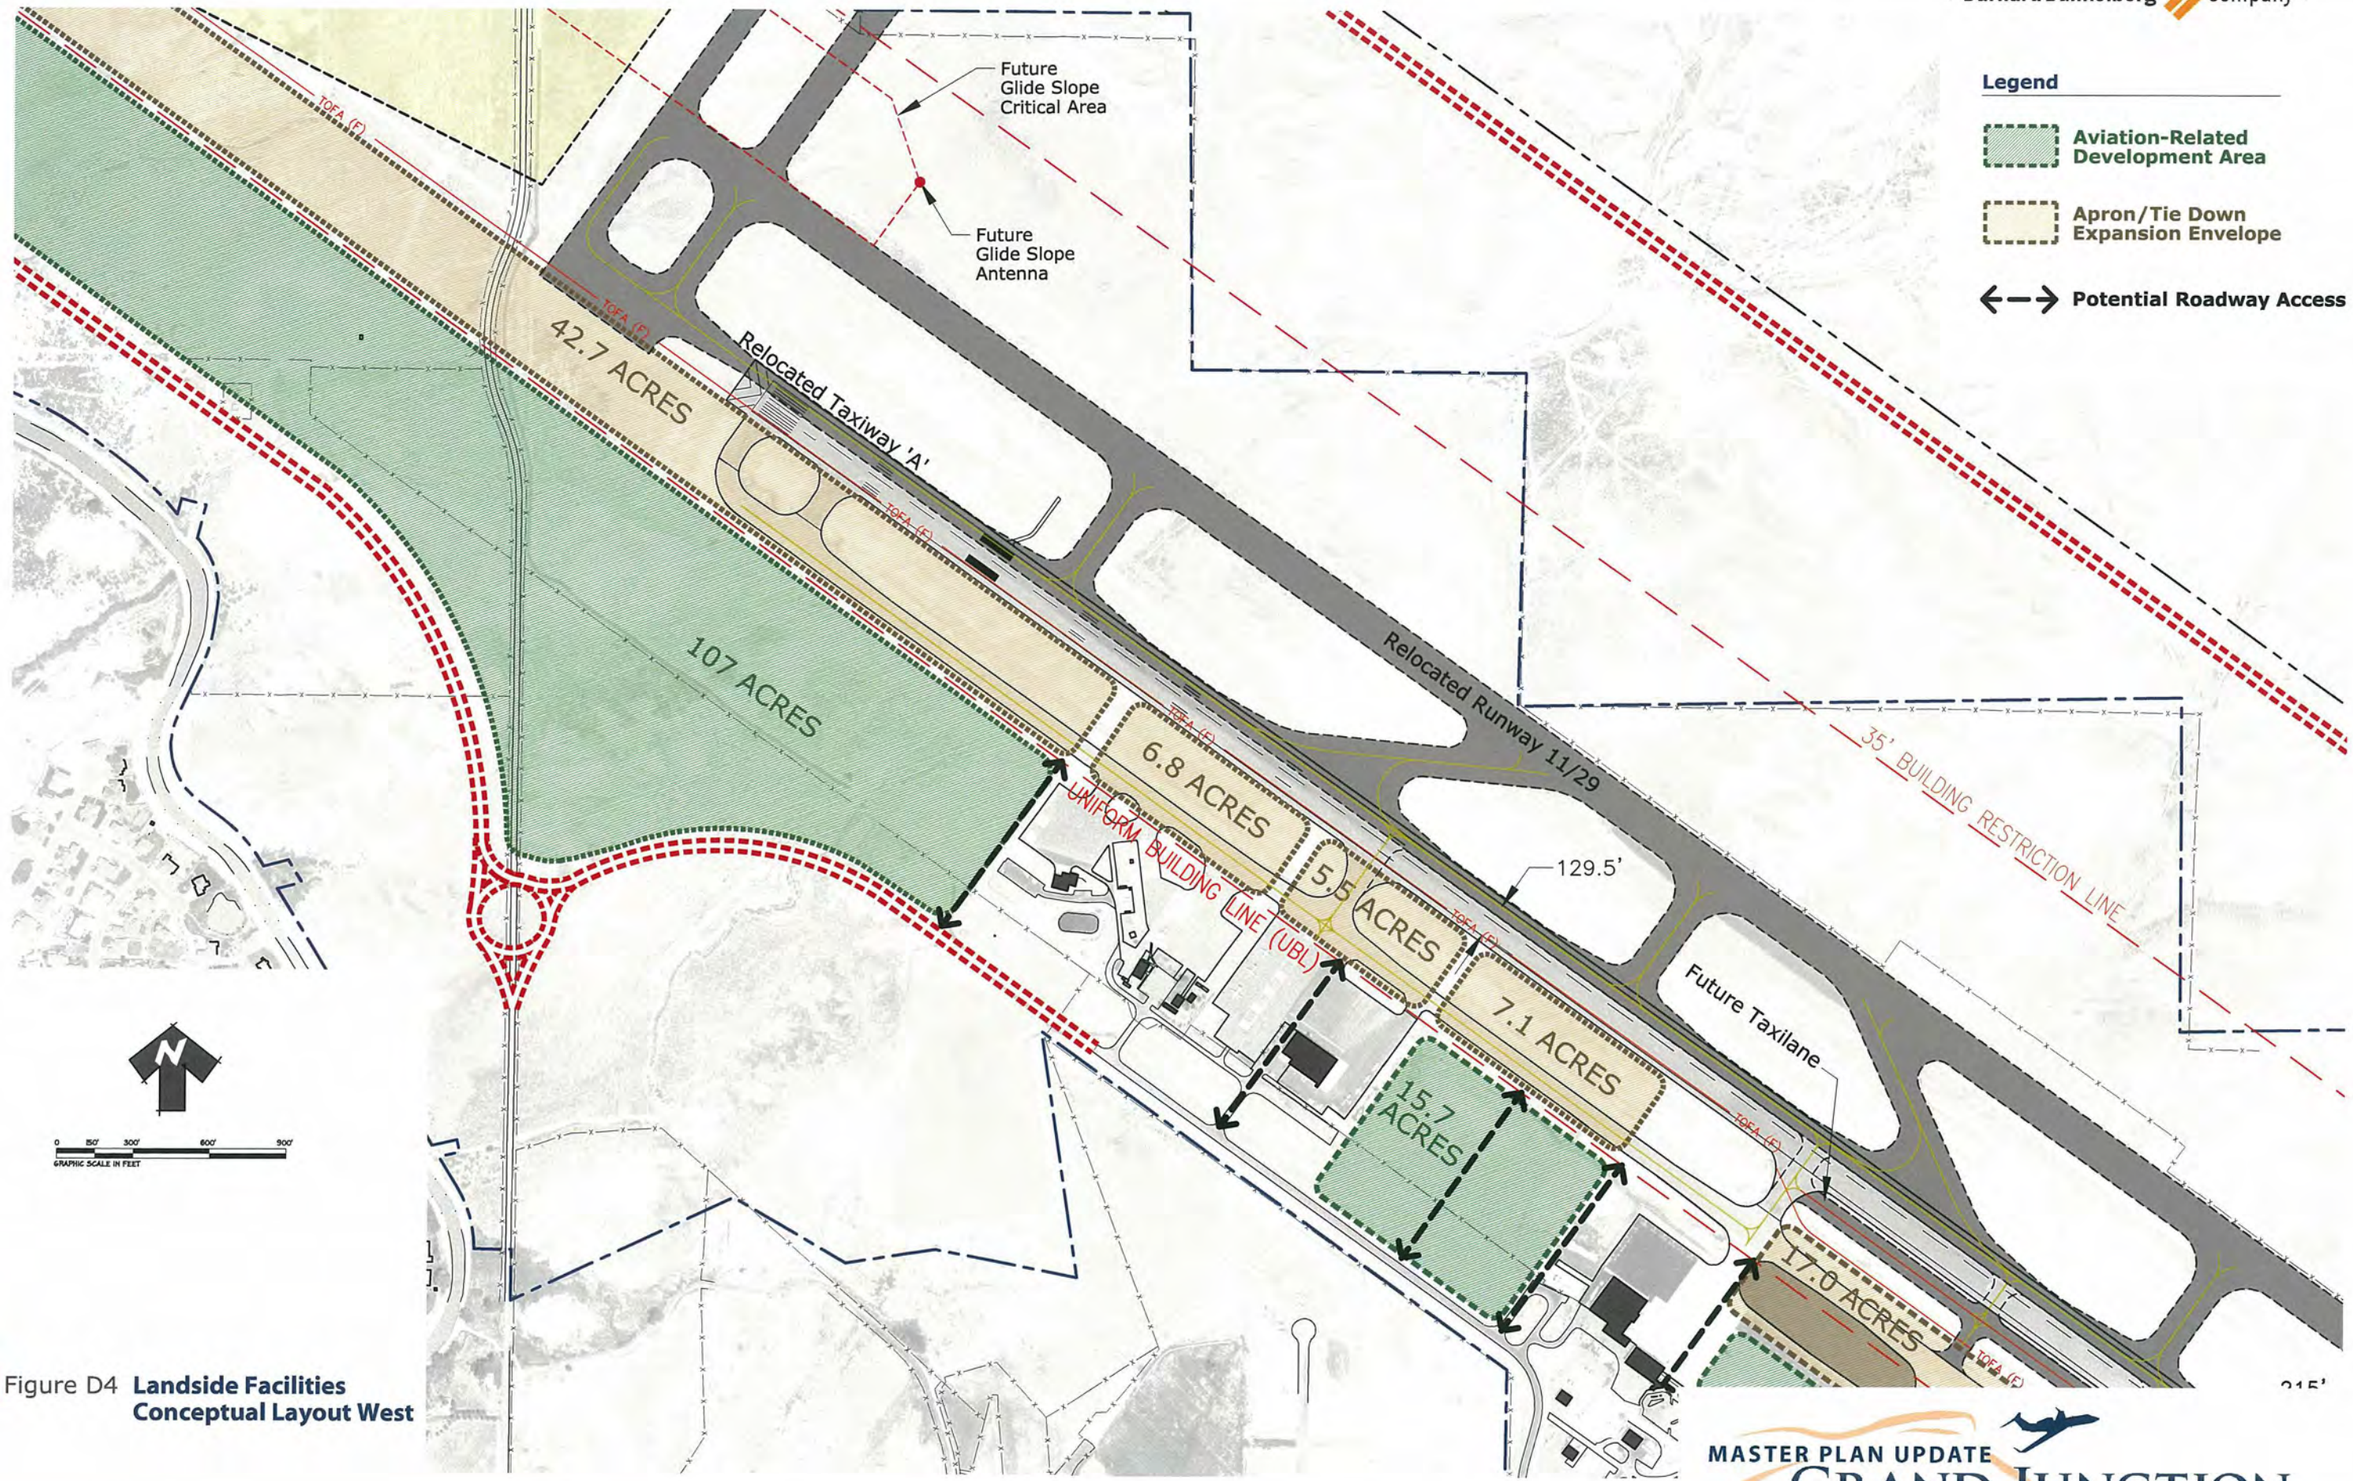

Figure D4 **Landside Facilities Conceptual Layout West**

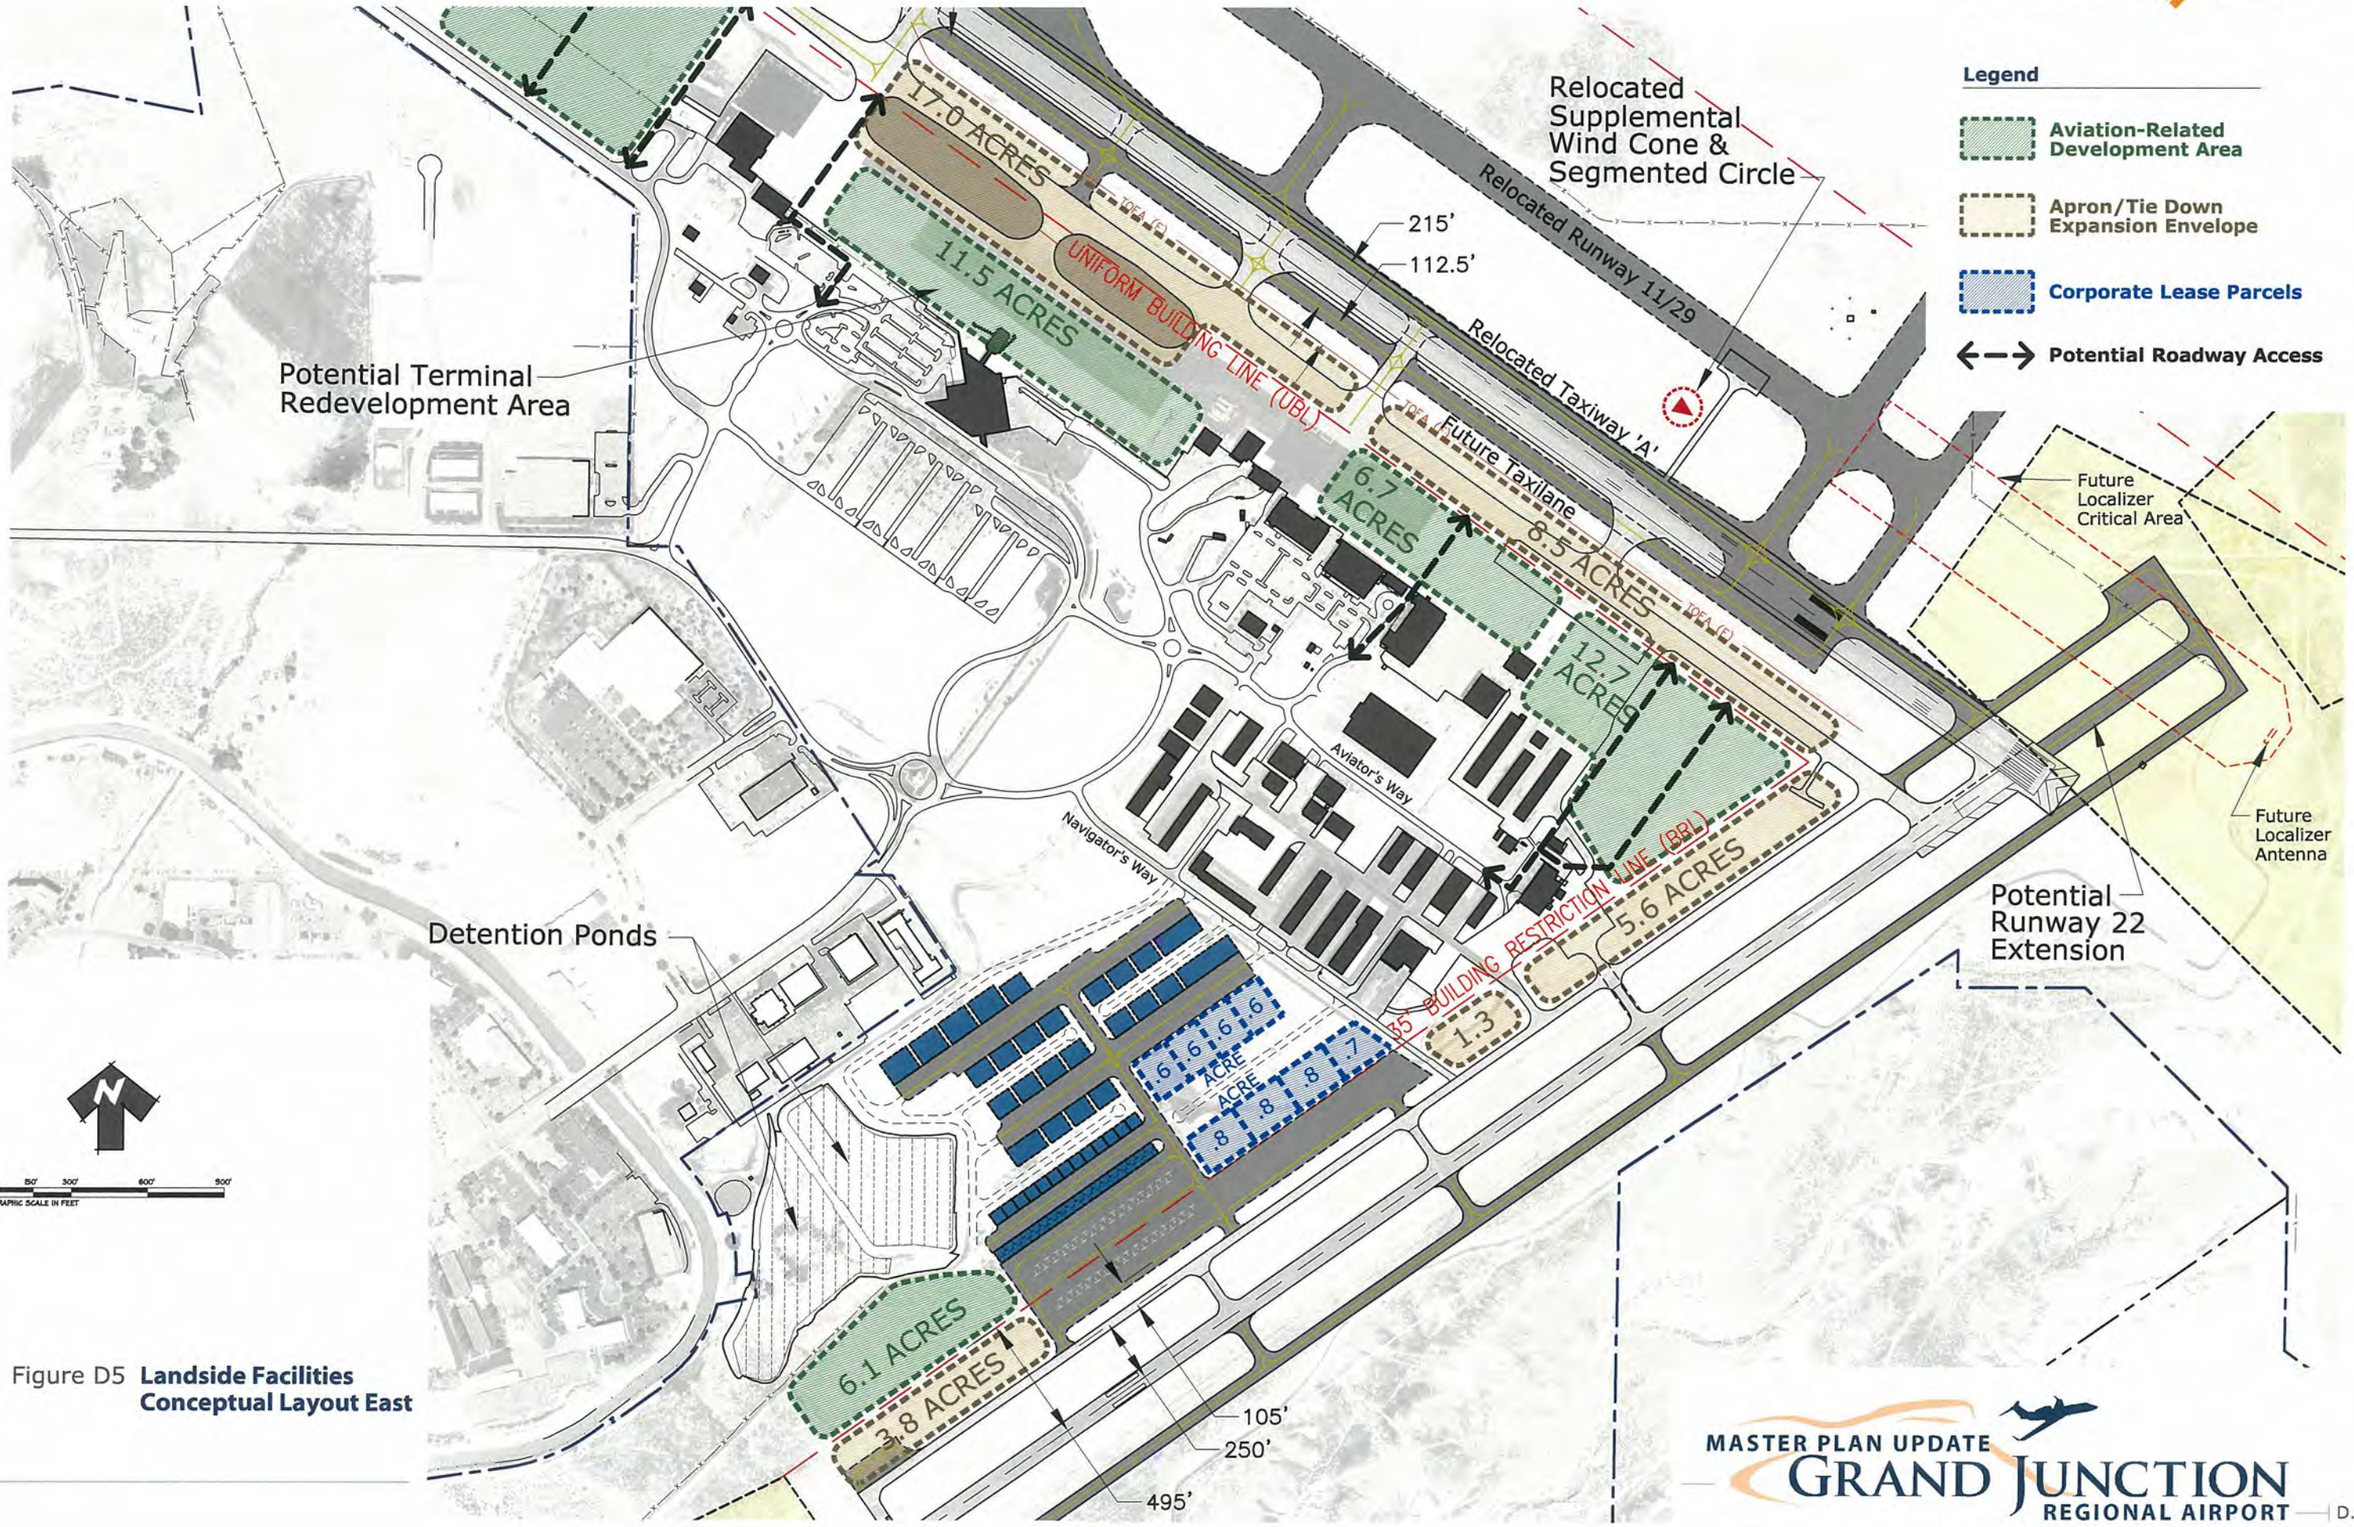

Figure D5 **Landside Facilities Conceptual Layout East**

Passenger Terminal Facilities

As identified in the previous chapter, the existing passenger terminal building is approaching capacity in various areas and consideration should be given to the space requirements to accommodate the forecast passenger demand at the Airport. Previous planning documents have introduced the potential alternative of relocating the passenger terminal and related facilities to the northwest side of Runway 11/29. However, as stated previously, this area has almost no landside access or infrastructure necessary for development and the extensions to properly serve the area would be very costly. Furthermore, the preferred alternative (Airside Alternative Two) would create an additional development envelope for terminal expansion that will better utilize the significant investment the Airport has made in both vehicle parking and landside access improvements in recent years. Additional space for both Transportation Security Administration (TSA) and airport administration/operations requirements should be programmed.

A potential passenger terminal redevelopment area and terminal apron expansion area are shown on the previous illustration entitled *LANDSIDE FACILITIES CONCEPTUAL LAYOUT EAST.* More detailed information related to this terminal redevelopment will be provided in later chapters of this Airport Master Plan Update.

General Aviation Aircraft Storage Facilities

The other significant current landside development issue that has been identified is development area for general aviation storage facilities (hangars) and for commercial aviation activity.

General aviation aircraft storage facilities can range from T-hangars, which house aircraft in individual walled-in units that are contained in a larger structure (in most cases, units are intended to accommodate one aircraft), to small conventional hangars (executive hangars, which can house one or two small- to medium-sized general aviation aircraft), to corporate hangars capable of housing one or more business jet aircraft. There are also large "gang storage" hangars that can house a number of aircraft under one roof without the separating partitions that characterize a T-hanger structure. This Airport Master Plan Update will provide a detailed "concept" layout of facilities to provide space for these various hangar types, but will also strive to provide flexibility so that the type of hangar built can be in response to actual demand. The primary area that has historically been reserved for general aviation facility expansion is located southwest of Navigators Way. The layout of these facilities, shown on the following illustration entitled *CONCEPTUAL GENERAL AVIATION FACILITIES LAYOUT*, has been revised to accommodate several large "corporate lease" parcels. These parcels could be leased to aviation-related businesses or businesses and institutions with corporate flight departments desiring to construct aircraft storage facilities with convenient access to the runway/taxiway system.

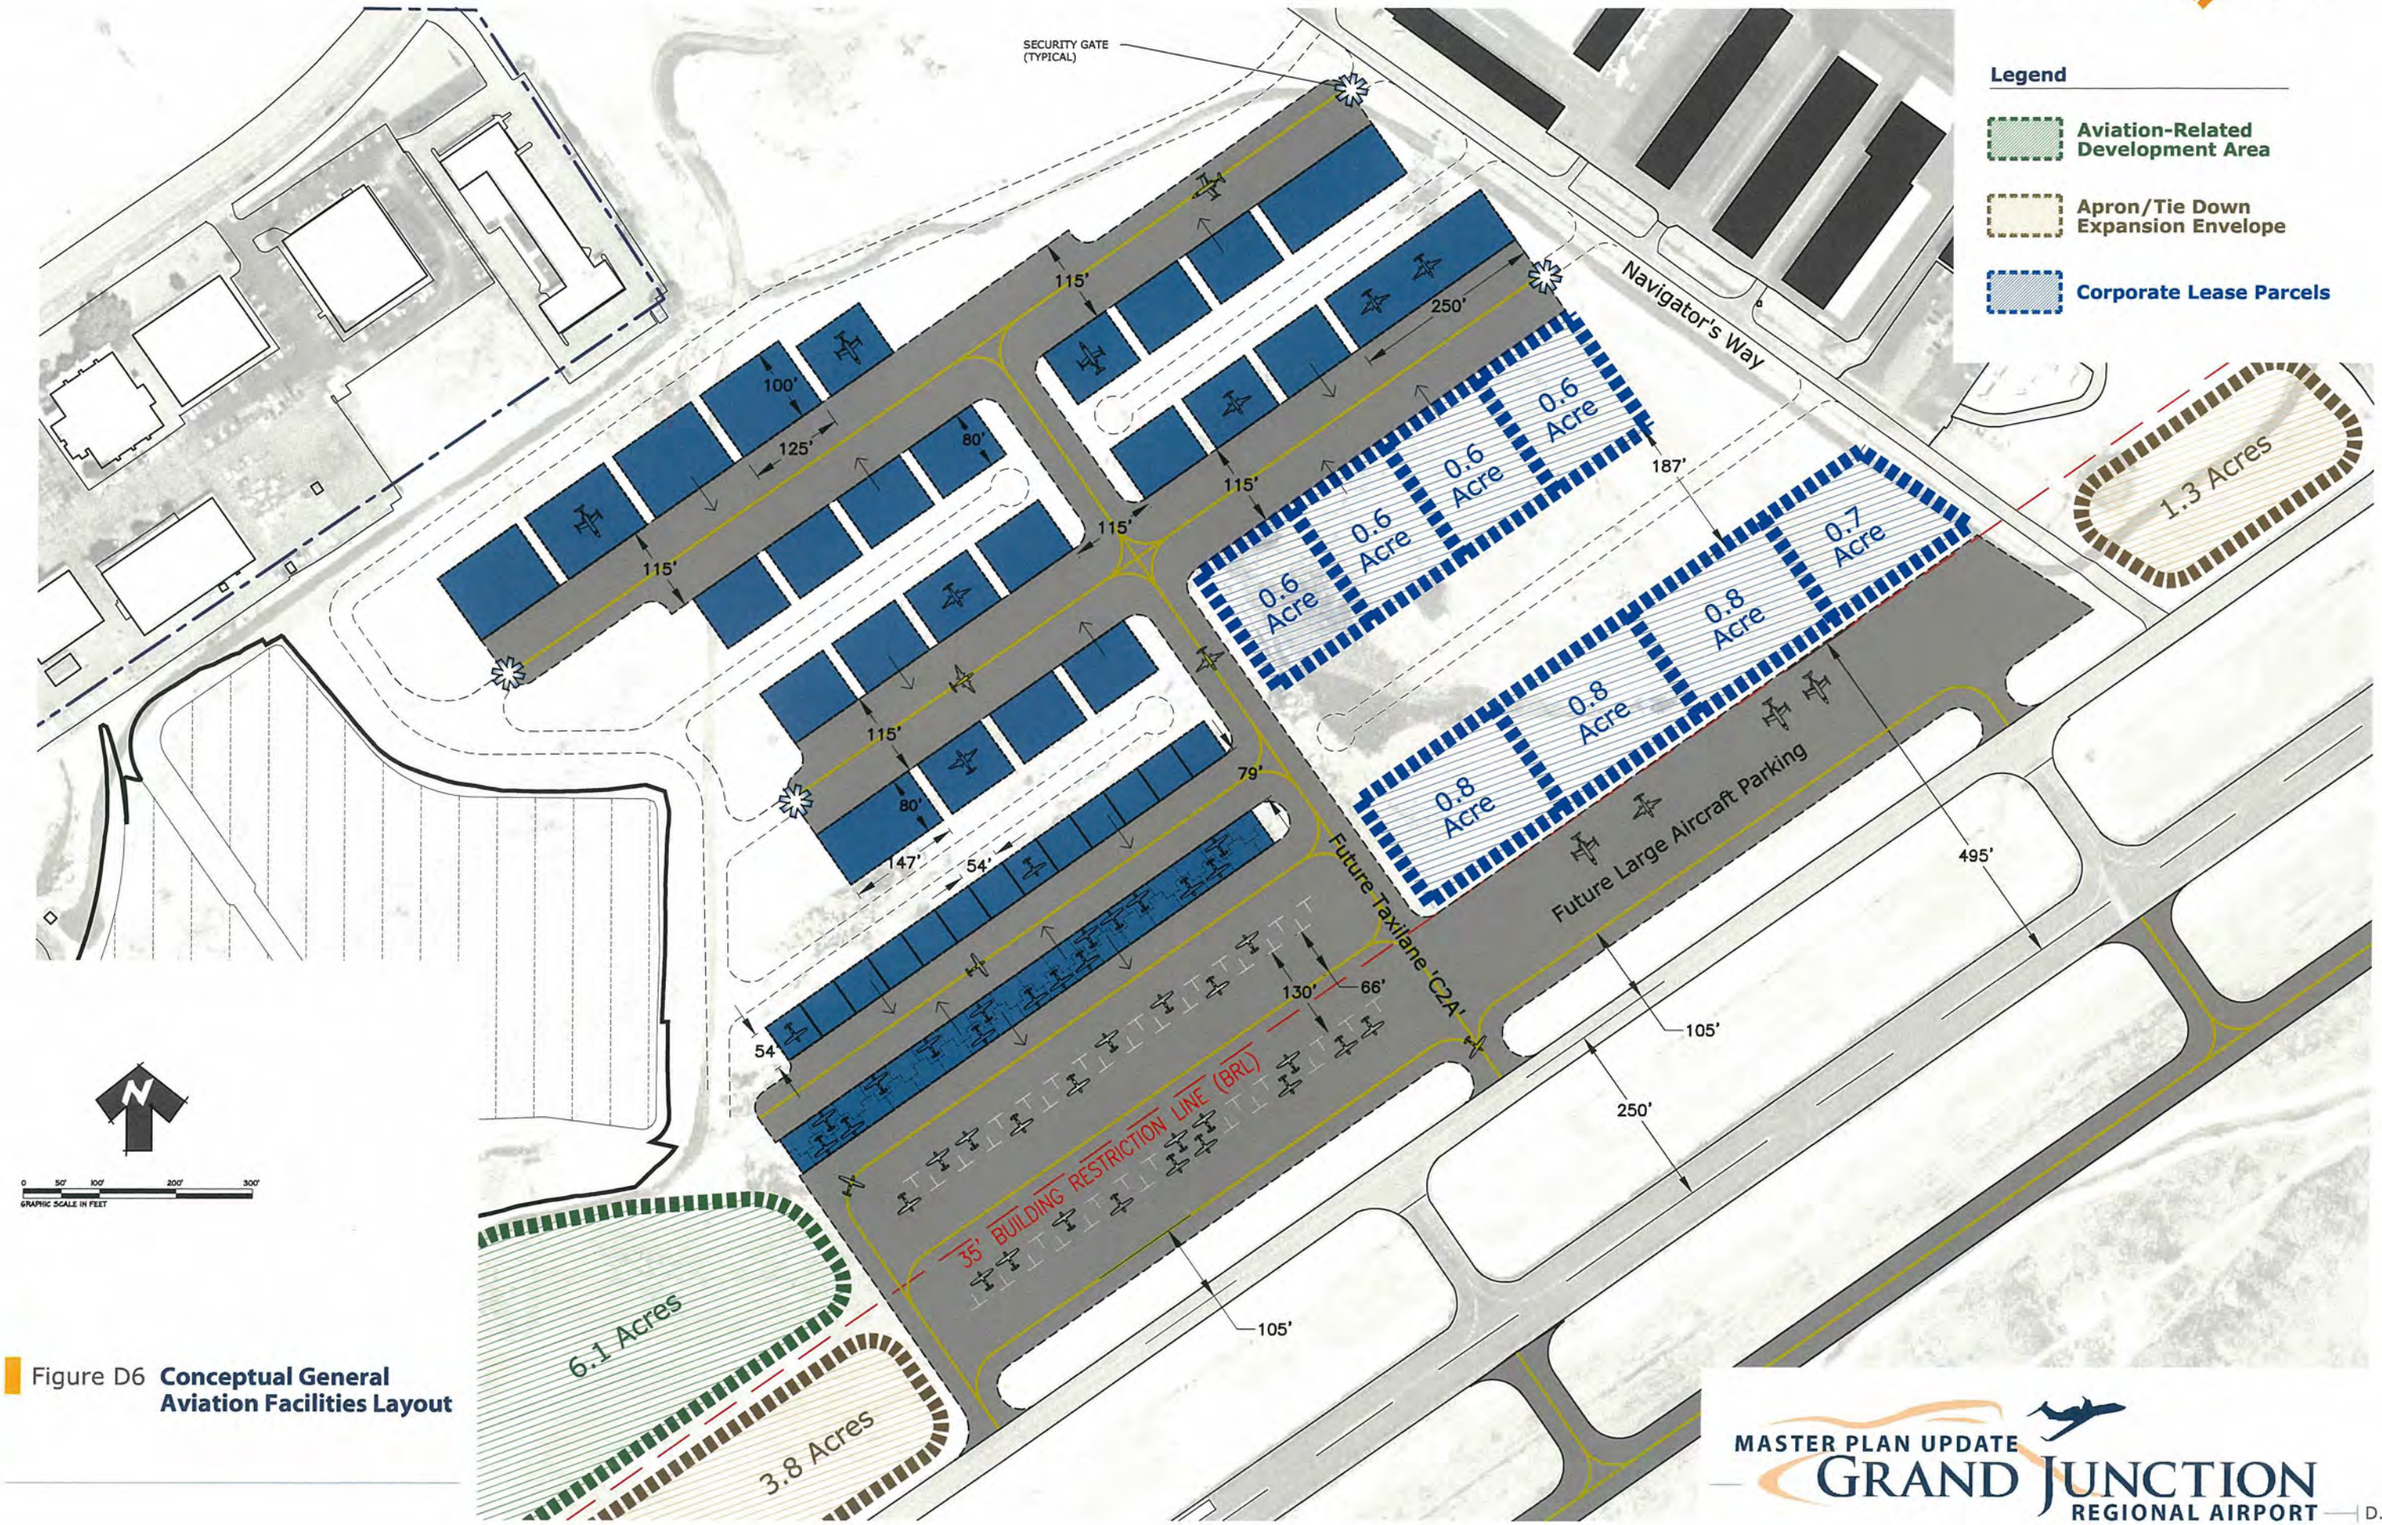

Figure D6 **Conceptual General Aviation Facilities Layout**

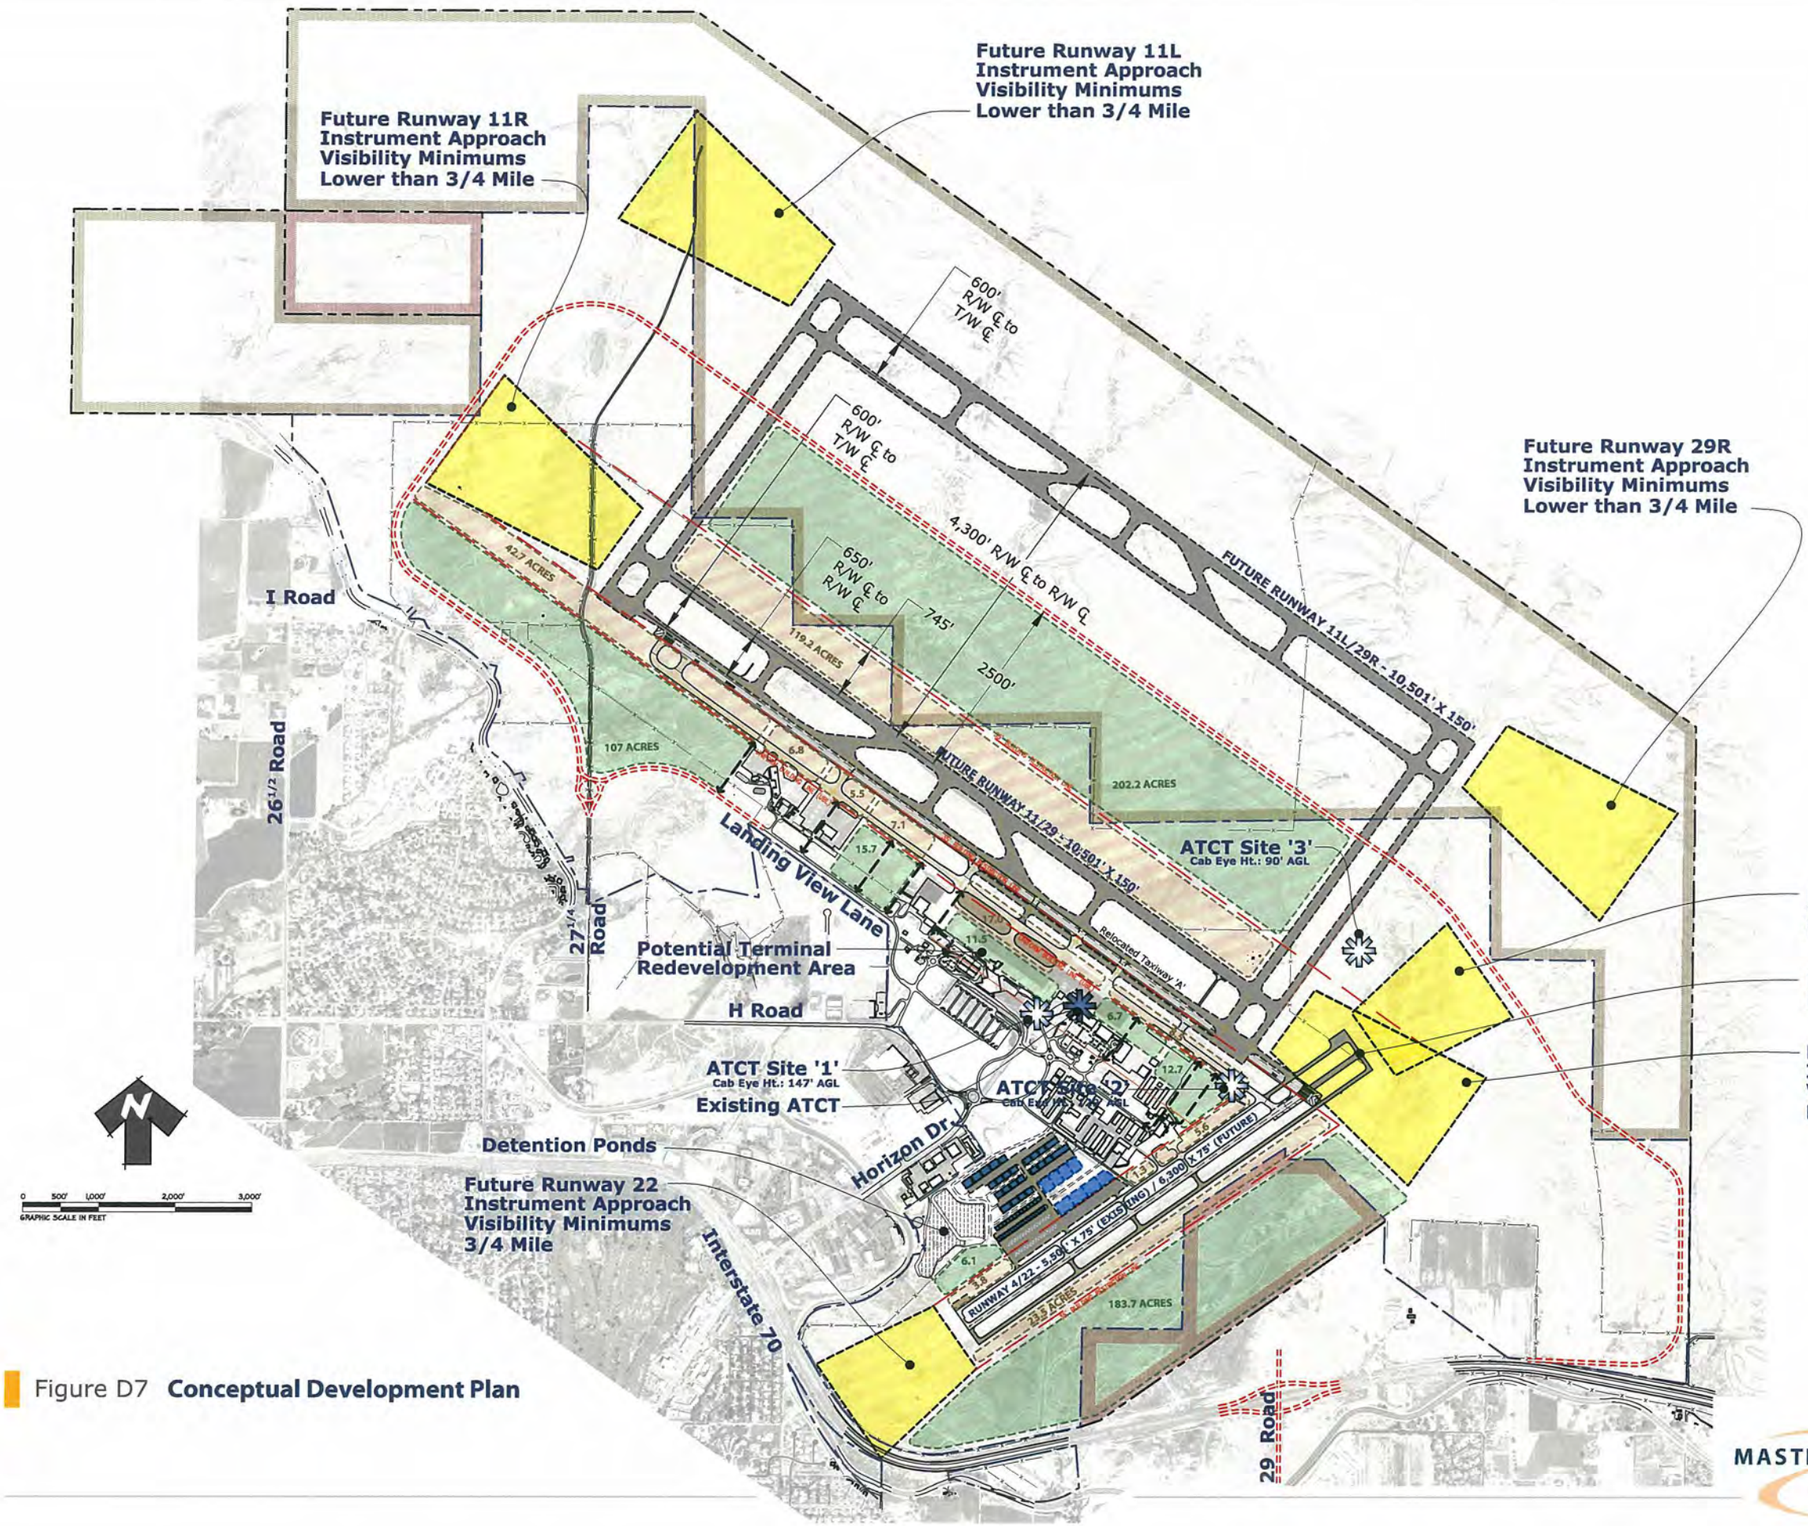
Land Acquisition Considerations



As can be noted on the previous illustrations, the Airport's facilities are located on a limited amount of property. To help ensure land use compatibility, approach protection, and to provide additional development area for aviation/airport support facilities, several parcels adjacent to airport property are being considered for acquisition. The parcels being considered for acquisition include Federal BLM land and private land. The BLM land north and west of the Airport is the highest priority for acquisition and a portion of this property is needed in order to implement Airside Alternative Two. Several parcels of state-owned land were recently acquired along the eastern airport property line. The purpose of this state land is both for approach protection as well as the potential for an ultimate north side airport access road. Finally, a parcel of private land southeast of Runway 4/22 is being considered for acquisition. Acquisition of this parcel would protect the Airport from potentially incompatible development within the Building Restriction Line (BRL) of Runway 4/22 and this parcel could potentially accommodate future aviation-related development. These parcels are shown in the previous airside alternative illustrations.

Conceptual Airport Development Plan

Following discussions and input from the Study Committee, airport stakeholders, airport staff, the public, and the Federal Aviation Administration, a conceptual development plan for Grand Junction Regional Airport was finalized. The *CONCEPTUAL DEVELOPMENT PLAN* for the Airport is illustrated in the following figure. Following the acceptance of this Conceptual Development Plan by the Airport Authority Board, the plan was utilized as the basis for the Environmental Review, the development of detailed Airport Plans, and the production of a long-term Capital Improvement Program for the Airport.

Airport Traffic Control Tower Location Analysis

Based on the Conceptual Development Plan, an ATCT location analysis was conducted in accordance with FAA Order 6480.4A, *Airport Traffic Control Tower Siting Process.* Siting considerations included TERPS criteria, FAR Part 77 criteria, sight distances and shadowing effects, and physical considerations such as infrastructure development, access, topography and general location factors, and facility construction costs. Three primary ATCT relocation sites were considered. The location of these sites, as well as the required cab eye height at each site, is shown on the following illustration entitled *CONCEPTUAL DEVELOPMENT PLAN.* The recommended preferred site is Site number 3, with a cab eye height of 90 feet above ground level (AGL). Selection of the final relocation site will be at the discretion of the FAA.

Environmental

E. Environmental Review

MASTER PLAN UPDATE

GRAND JUNCTION

REGIONAL AIRPORT

E. Environmental Review

The following narrative presents an analysis and inventory of environmental information gathered through research and data collection. The purpose of this analysis and inventory is to provide preliminary information concerning environmental resources in an effort to define and identify critical resources that would need to be addressed in the preparation of environmental documentation for the proposed airport development.

Alternatives involving the future configuration of the Airport have been reviewed in previous chapters. The primary changes proposed in the airport layout include the acquisition of BLM land north and east of the Airport, the acquisition of private land south of Runway 4/22, the relocation of Runway 11/29 approximately 650 feet to the north and east, the conversion of the current Runway 11/29 to a parallel taxiway, and the expansion of apron and landside development areas associated with the relocation of Runway 11/29.

Existing Conditions

Mesa County is located within the temperate steppe mountain ecoregion of west-central Colorado. The Airport is located on sloping terrain and the Colorado River and the Gunnison River are the predominant water features in the vicinity of the Airport. Both rivers join approximately four miles southwest of the Airport. The climate of Mesa County is characterized as mild, with an average annual rainfall of approximately 8.6 inches and an average annual snowfall of approximately 25.1 inches. Average annual maximum temperature is 65° F, and the average annual minimum temperature is 40° F.

The City of Grand Junction and Mesa County both have zoning and development codes that help guide development. Areas to the south and west of the Airport consist of various zoning districts including both residential and non-residential zoning districts. Existing zoning within airport environs south and west of the Airport is predominantly residential and industrial with some business/commercial, public facilities, and planned development. The majority of the land north and east of the Airport is owned by the Bureau of Land Management (BLM) and is zoned by Mesa County as Agricultural, Forestry, Transitional district (AFT). The AFT district is primarily intended to accommodate agricultural operations and very low-density single-family residential development.

Mesa County had an estimated population of approximately 139,082 in 2007. Through the Grand Junction Regional Communication Center, the City of Grand Junction Police Department provides crime protection for the Airport, with airport fire protection being provided by the Airport's Index B Aircraft Rescue and Fire Fighting Facility (ARFF) facility and the Grand Junction Fire Department. The nearest landfill (Mesa County Landfill) is located approximately five miles southeast of the City of Grand Junction (eight miles south of the Airport).

Surface transportation access to the Airport is provided via Horizon Drive and H Road. Horizon Drive connects with Interstate 70 less than one mile southwest of the airport entrance.

Future Conditions

The following future conditions discussion is based on the assumption that all the projects included in the proposed 20-year capital funding plan are implemented. An analysis of the potential environmental impacts of implementing these projects allows for the identification of any potentially significant environmental concerns and also allows for the identification of the level of documentation required to receive environmental clearance for each project. It is anticipated that at least two reasonably foreseeable projects will require the preparation of Environmental Assessments (EAs), including the relocation of Runway 11/29 and its associated land acquisition and the relocation of the Airport Traffic Control Tower (ATCT). It is also possible that the reconstruction or relocation of the passenger terminal will require the preparation of an EA.

Noise

Noise is generally defined as unwanted sound and, as such, the determination of acceptable levels is subjective. The day-night sound level (DNL) methodology is used to determine both the noise levels resulting from existing conditions and the potential noise levels that could be expected to occur with the proposed project. The basic unit in the computation of DNL is the Sound Exposure Level (SEL). An SEL is computed by adding the "A" weighted decibel level [dB(A)] level for each second of a noise event above a certain threshold ("A" weighted refers to the sound scale pertaining to the human ear). For example, a noise monitor located in a quiet residential area [40 dB(A)] receives the sound impulses of an approaching aircraft and records the highest dB(A) reading for each second of the event as the aircraft approaches and departs the site. Each of these one-second readings is then added logarithmically to compute the SEL.

The computation of DNL involves the addition, weighting, and averaging of each SEL to achieve the DNL level in a particular location. The SEL of any single noise event occurring between the hours of 10:00 p.m. and 7:00 a.m. is automatically weighted by adding 10 dB(A) to the SEL to account for the assumed additional irritation perceived during that time period. All SELs are then averaged over a given time period (day, week, year) to achieve a level characteristic of the total noise environment. Very simply, a DNL level for a specified area over a given time is approximately equal to the average dB(A) level that has the same sound level as the intermittent noise events. Thus, a DNL 65 level describes an area as having a constant noise level of 65 dB(A), which is the approximate average of single noise events even though the area would experience noise events much higher than 65 dB(A) and periods of quiet.

The main advantage of DNL is that it provides a common measure for a variety of differing noise environments. The same DNL level can describe both an area with very few high level noise events and an area with many low level events. DNL is thus constructed because it has been found that the total noise energy in an area predicts community response.

DNL levels are usually depicted as grid cells or contours. Grid cells are squares of land of a specific size that are entirely characterized by a noise level. Contours are interpolations of noise levels based on the centroid of a grid cell and drawn to connect all points of similar level. Contours appear similar to topographical contours and form concentric "footprints" about a noise source. These footprints of DNL contours drawn about an airport are used to predict community response to the noise from aircraft using that airport.

Computer Modeling. The DNL noise contours were generated using the Integrated Noise Model (INM) Version 7.0a, specifically developed by the Federal Aviation Administration (FAA) for modeling the noise environment at airports. The program is provided with standard aircraft noise and performance data, which can be tailored to the characteristics of individual airports. The INM program requires the input of the physical and operational characteristics of the airport. Physical characteristics include runway end coordinates, displaced thresholds, airport elevation, and temperature. Operational characteristics include aircraft mix, flight tracks, and runway utilization. Optional data that can be incorporated in the model includes approach and departure profiles, approach and departure procedures, and aircraft noise curves.

Using the existing and forecast aircraft operations presented earlier, two sets of noise contours have been generated, an existing (2007) set and a future (2027) set. Illustrations and descriptions of the potential impacts to the surrounding land uses for each set of noise contours follow.

2007 Noise Impacts. The existing noise contours and the anticipated effect on the surrounding land uses are presented in the following figure entitled *BASELINE (2007) NOISE CONTOURS W/GENERALIZED FUTURE LAND USE*. The 65 DNL noise contour encompasses roughly 2,360 acres, and the 60 DNL noise contour contains about 4,903 acres. As can be seen, the 65 DNL noise contours extend beyond the airport boundary off both ends of Runway 11/29. Noise sensitive land uses consisting of residential development exist off the departure end of Runway 11. A planned residential land use exists off the departure end of Runway 29.

2027 Noise Impacts. The future 2027 noise contours and the anticipated effect on the surrounding land uses are illustrated in the figure entitled *FUTURE (2027) NOISE CONTOURS W/GENERALIZED FUTURE LAND USE*. In comparison, the 2027 noise contours are only slightly larger than the 2007 contours and shifted north and east due to the proposed Runway 11/29 relocation. The 65 DNL noise contour encompasses about 2,365 acres, and the 60 DNL noise contour includes approximately 4,928 acres. The incompatible residential land uses off the departure end of Runway 11 are almost completely removed from the 65 DNL contour by the proposed runway relocation. However, the planned residential land use off the departure end of the relocated Runway 29 is still located within the future 65 DNL contour. It is recommended that the Airport work with the City of Grand Junction to plan a more compatible land use on this parcel.

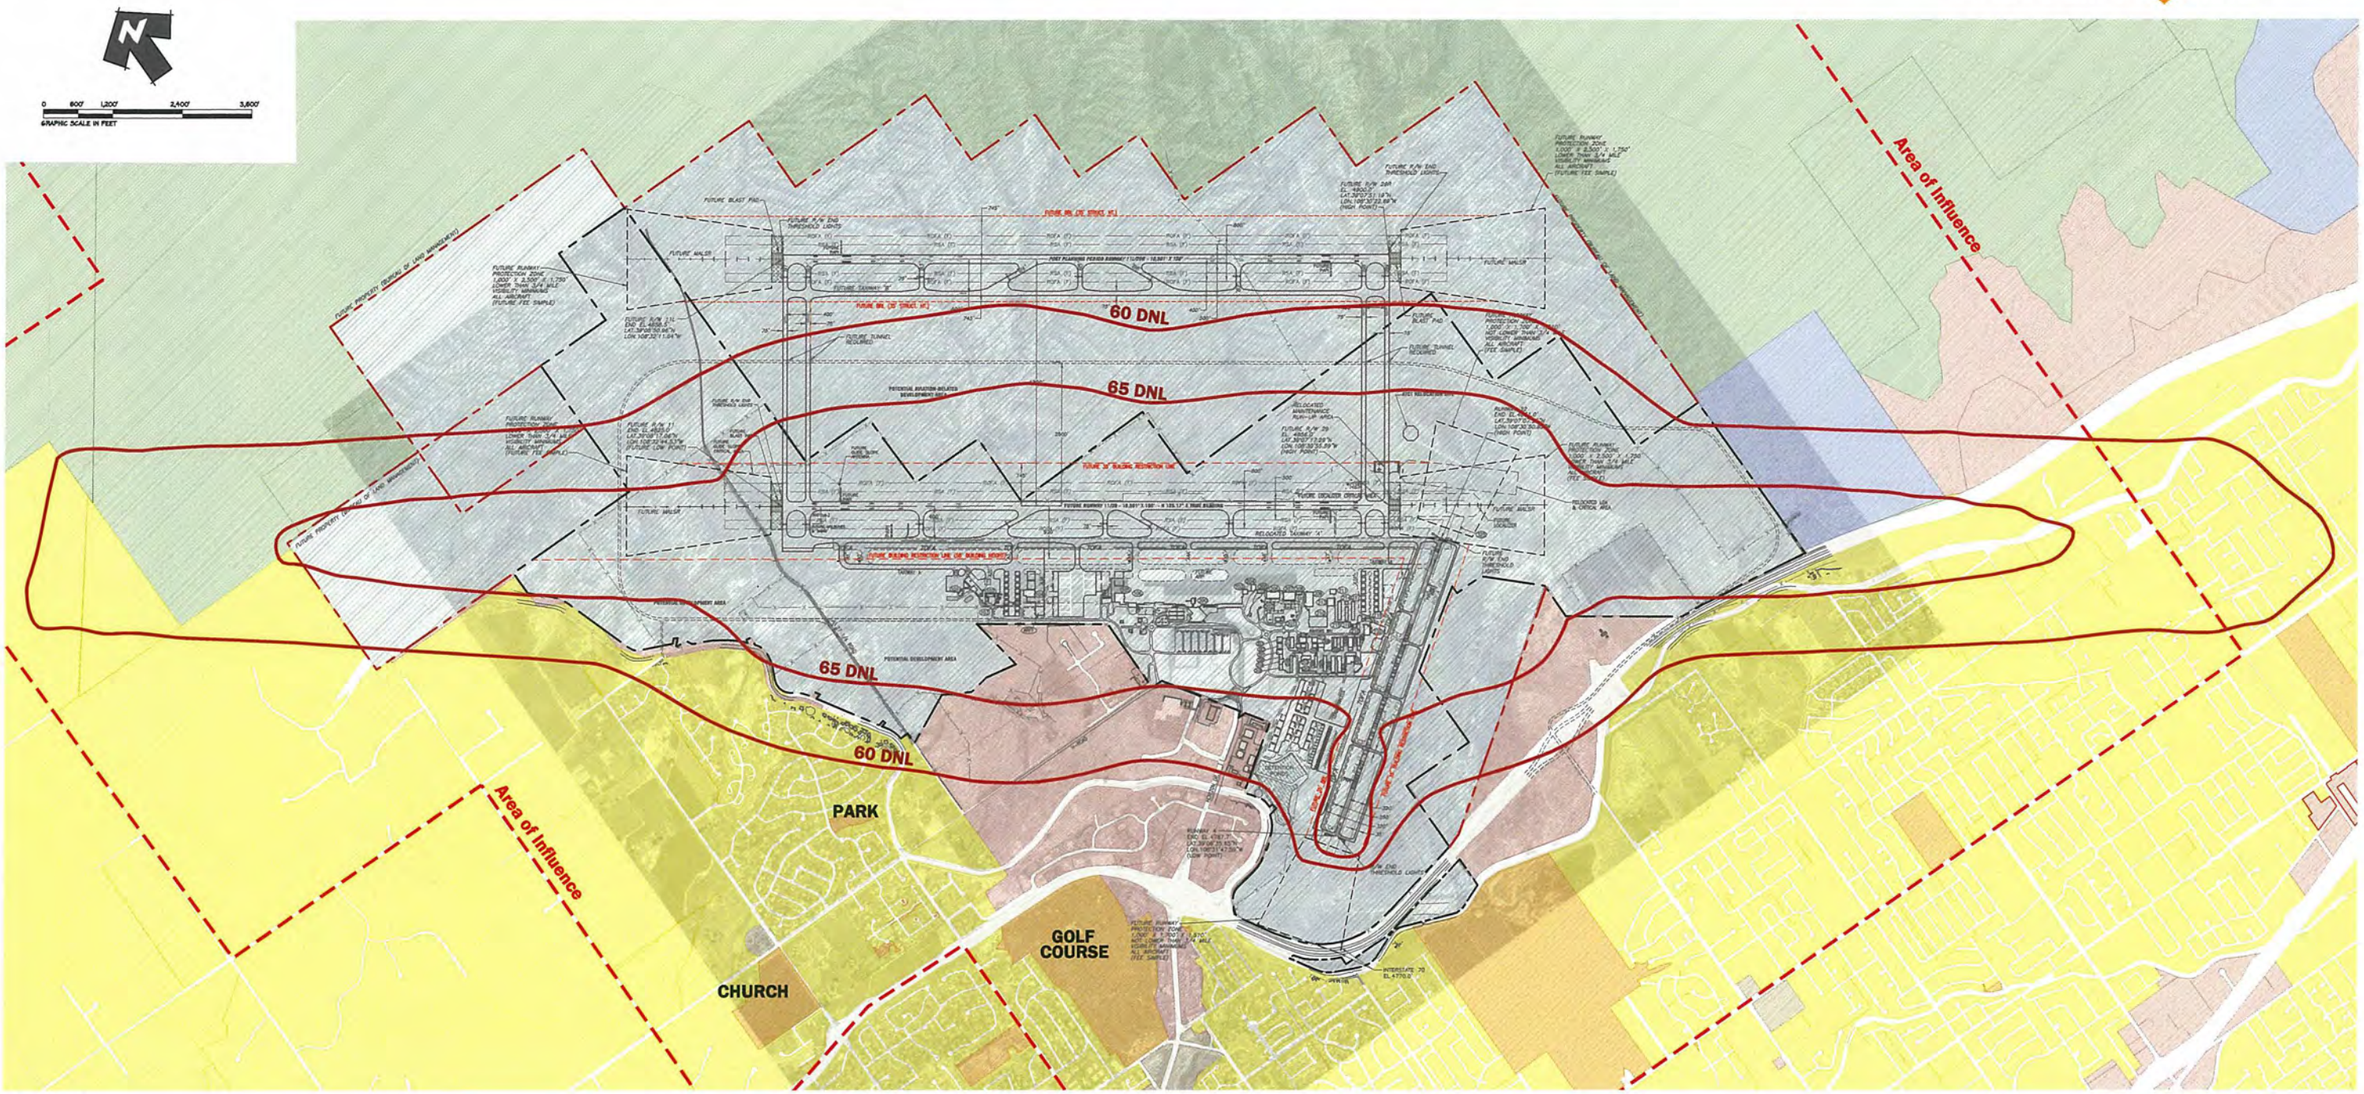

Figure E1 **Baseline (2007) Noise Contours w/Generalized Future Land Use**

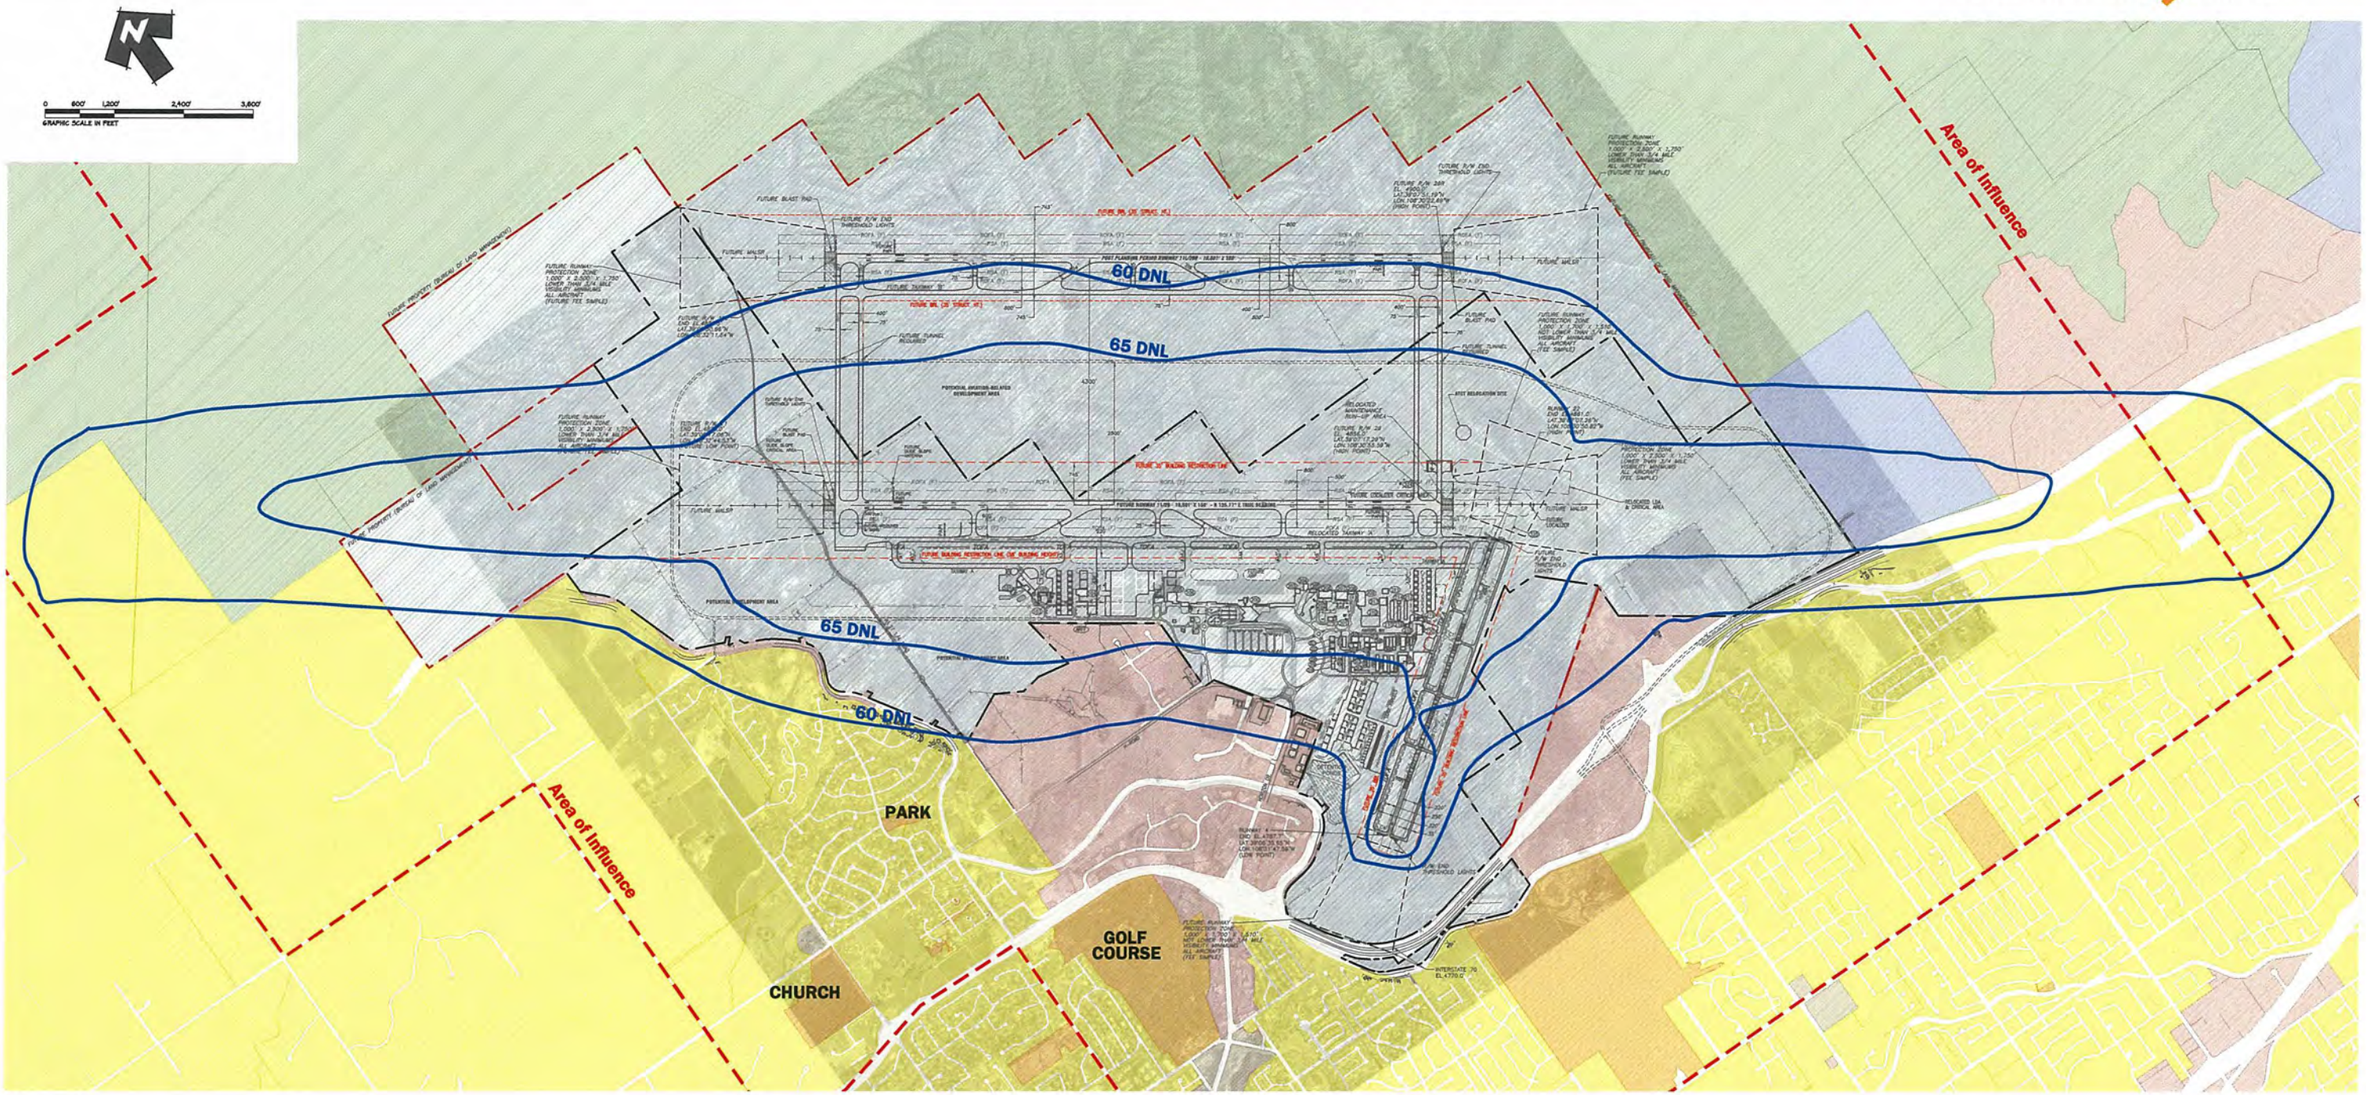

Figure E2 **Future (2027) Noise Contours w/Generalized Future Land Use**

Compatible Land Use

Establishing land use compatibility within airport environs is the responsibility of local authorities, but should be based on a recognized standard. Federal Aviation Regulation (FAR) Part 150 *Land Use Compatibility Guidelines* are the acknowledged standard by the federal government regarding aircraft noise at airports. The following illustration, entitled *LAND USE COMPATIBILITY MATRIX*, indicates those land uses that are compatible within certain DNL noise contours. It identifies land uses as being compatible, incompatible, or compatible if sound attenuated.

The guidelines can act as a guide to the city and county for establishing sensible land use planning and control practices, and as a tool for comparing relative land use impacts resulting from the proposed airport development. It must be remembered that the DNL noise contours do not delineate areas that are either free from excessive noise or areas that will be subjected to excessive noise. In other words, it cannot be expected that a person living on one side of a DNL noise contour will have a markedly different reaction than a person living nearby, but on the other side. What can be expected is that the general aggregate community response to noise within the DNL 65 noise contour, for example, will be less than the public response from the DNL 75 noise contour.

The area between the 60 and 65 DNL noise contours is an area within which most land uses are compatible, but is also an area where single event noise complaints are often received. It is strongly recommended that the Airport consider adopting the 60 DNL noise contour as the official land use compatibility planning contour following the construction of the new Runway 11/29.

The area between the 65 and 70 DNL noise contours is an area of significant noise exposure, where many types of land uses are normally unacceptable and where land use compatibility controls are recommended. Finally, the area inside the 70 and 75 DNL noise contour identifies land uses that are subjected to a significant level of noise, and the sensitivity of various uses to noise is increased.

LAND USE	BELOW 65	YEARLY DAY-NIGHT NOISE LEVEL (DNL) IN DECIBELS 65-70	70-75	75-80	80-85	OVER 85
RESIDENTIAL

Numbers in parentheses refer to NOTES.

The designations contained in this table do not constitute a Federal determination that any use of land covered by the program is acceptable or unacceptable under Federal, State or local law. The responsibility for determining the acceptable and permissible land uses and the relationship between specific properties and specific noise contours rests with the local authorities. FAA determinations under Part 150 are not intended to substitute federally determined land uses for those determined to be appropriate by local authorities in response to locally determined needs and values in achieving noise compatible land uses.

TABLE KEY

SLUCM	Standard Land Use Coding Manual.
Y(Yes)	Land Use and related structures compatible without restrictions.
N(No)	Land Use and related structures are not compatible and should be prohibited.
NLR	Noise Level Reduction (outdoor to indoor) to be achieved through incorporation of noise attenuation into the design and construction of the structure.
25, 30 or 35	Land Use and related structures generally compatible; measures to achieve NLR of 25, 30 or 35 dB must be incorporated into design and construction of structure.

NOTES

(1) Where the community determines that residential or school uses must be allowed, measures to achieve outdoor to indoor Noise Level Reduction (NLR) of at least 25 dB to 30 dB should be incorporated into building codes and be considered in individual approvals. Normal residential construction can be expected to provide a NLR of 20 dB, thus, the reduction requirements are often stated as 5, 10 or 15 dB over standard construction and normally assume mechanical ventilation and closed windows year round. However, the use of NLR criteria will not eliminate outdoor noise problems.

(2) Measures to achieve NLR of 25 dB must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise sensitive areas or where the normal noise level is low.

(3) Measures to achieve NLR of 30 dB must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise sensitive areas or where the normal noise level is low.

(4) Measures to achieve NLR of 35 dB must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise sensitive areas or where the normal noise level is low.

(5) Land use compatible provided that special sound reinforcement systems are installed.

(6) Residential buildings require an NLR of 25.

(7) Residential buildings require an NLR of 30.

(8) Residential buildings not permitted.

Figure E3 **Land Use Compatibility Matrix**

Air Quality

The proposed development outlined in this Master Plan Update is not expected to have a significant impact on the long-term quality of the air in the vicinity of the Airport. According to the U.S. Environmental Protection Agency (EPA), Mesa County is in attainment area with federal health-based air quality standards known as the National Ambient Air Quality Standards (NAAQS). A non-attainment area is defined as a locality where air pollution levels persistently exceed the NAAQS. The EPA normally makes this designation only after air quality standards have been exceeded for several consecutive years. The forecast 2027 annual general aviation operations (i.e., 84,548) and passengers (i.e., 371,423) are well below the threshold (180,000 general aviation operations and 1.3 million passengers, according to the *Air Quality Procedures for Civilian Airports and Air Force Based Handbook*) required to do a NAAQS assessment. Furthermore, a conformity analysis conducted to ensure actions included in a non-attainment or maintenance area "conforms" to any relevant State Implementation Plan (SIP) will not be required because Mesa County is not considered a non-attainment or maintenance area.

Short-term air quality impacts may be expected from heavy equipment pollutant emissions, fugitive dusts resulting from cut and fill activities, and the operation of portable concrete batch plants. Compliance with all applicable local, state, and federal air quality regulations and permitting requirements will be the responsibility of all contractors.

Water Quality

The most significant hydrological features in the area include the Colorado River, located south of the Airport, and the Gunnison River, located southwest of the Airport. Both of these rivers join just south of the Grand Junction Central Business District, approximately four miles southwest of the Airport. Additionally, the Indian Wash Creek is located along the eastern border of airport property, and Leach Creek is located to the west of the Airport. Both creeks intersect with the Government Highline Canal that is located west and south of the Airport. Proposed airport development including the relocation of Runway 11/29 may impact these drainages and should be further studied in the Runway 11/29 Environmental Assessment. Discussion of the potential impacts of airport development is included in Appendix One, Master Drainage Report.

Any construction projects requiring earthwork will result in some erosion and sedimentation. However, the contractors would be required to follow guidelines outlined in the Federal Aviation Administration's Advisory Circular 150/5370-10A, *Standards for Specifying Construction of Airports*, which is the FAA's guidance to airport sponsors concerning protection of the environment during construction. Final plans and specifications for any project will incorporate

the provisions of AC 150/5370-10A to ensure minimal impact due to erosion, air pollution, sanitary waste, and the use of chemicals.

Historical, Architectural, Archaeological, and Cultural Resources

Section 106 of the National Historic Preservation Act requires federal agencies, or their designated representatives, to take into account the effects of their undertakings on historic properties, which include archaeological sites, buildings, structures, objects, or districts. The National Register of Historic Places indicates while there are several historic sites within Grand Junction, there are no known historic properties on or near the Airport that would be affected by the proposed airport improvement projects. However, a Class III Cultural Resource Survey should be conducted during the Runway 11/29 Environmental Assessment to meet BLM and FAA requirements. The results of this survey should be coordinated with the Colorado Historical Society and any potential tribal interests.

Should any construction activity expose buried archaeological material, work will stop in that area and the FAA and the Colorado Historical Society will be contacted.

Fish, Wildlife, and Plants

The *Endangered Species Act*, as Amended, requires each federal agency to insure that any action authorized, funded, or carried out by such agency is not likely to jeopardize the continued existence of any endangered or threatened species or result in the destruction or adverse modification of habitat of such species. According to the U.S. Department of the Interior Fish and Wildlife Service, Ecological Services, there are eight threatened, endangered, and candidate species located within Mesa County, Colorado (as of February 2008). The following table, entitled *MESA COUNTY THREATENED, ENDANGERED, AND CANDIDATE SPECIES*, lists the threatened, endangered, and candidate species for the County. Before any projects could be undertaken, the Airport would need to determine if these threatened and endangered species are located on airport property, within the proposed project area.

Table E1
MESA COUNTY THREATENED, ENDANGERED, AND CANDIDATE SPECIES

Common Name	Scientific Name	Status
Bonytail[1]	*Gila elegans*	Endangered
Canada lynx	*Lynx canadensis*	Threatened
Colorado pikeminnow[1]	*Ptychocheilus lucius*	Endangered
De Beque phacelia	*Phacelia submutica*	Candidate
Humpback chub[1]	*Gila cypha*	Endangered
Razorback sucker[1]	*Xyrauchen texanus*	Endangered
Uinta Basin hookless cactus	*Sclerocactus glaucus*	Threatened
Yellow-billed cuckoo	*Coccyzus americanus*	Candidate

Sources: *U.S. Department of the Interior- Fish and Wildlife Service, Ecological Services- Colorado Field Offices, February 2008. U.S. Fish & Wildlife Service, Threatened & Endangered Species System.*
[1] Designated critical habitat for the species are within the county.

Floodplains and Wetlands

As stated previously, the Airport is located on gently sloping terrain and all drainages in the vicinity of the Airport eventually flow to the Colorado River. Floodplain and drainage impacts are a concern with any project constructed at the Airport and should be designed in accordance with the Airport's Master Drainage Report (see Appendix One).

Wetlands are basically defined as areas inundated by surface or groundwater, with a frequency sufficient to support vegetation or aquatic life requiring saturated or seasonally saturated soil conditions for growth and reproduction. Wetlands generally include swamps, marshes, bogs, sloughs, river overflows, mud flats, and natural ponds. Wetlands also include estuarine areas, tidal overflows, shallow lakes and ponds with emergent vegetation, and wetland ecosystems, including those areas that affect, or are affected by, the wetland itself (e.g., adjacent uplands or regions upstream and downstream).

According to the National Wetlands Inventory maintained by the US Fish and Wildlife Service, there are several other freshwater wetlands in the vicinity of Grand Junction Regional Airport. Some of these wetlands may be impacted by one or more of the projects proposed for airside development improvements. Because of this potential for impact, a wetlands delineation should be completed and coordinated with the Army Corps of Engineers (the Corps) during the Runway 11/29 EA. The proposed project may be subject to regulation pursuant to Section 404 of the Clean Water Act and either an individual or nationwide permit may be required.

Wild and Scenic Rivers

According to a listing of Wild and Scenic Rivers compiled and managed by the Army Corps of Engineers, the Bureau of Land Management, the National Park Service, the U.S. Forest Service, and the U.S. Fish and Wildlife Service, there are no wild and scenic rivers located within the vicinity of Grand Junction Regional Airport. Therefore, there will not be any impacts to a nationally significant river resource as a result of the proposed airport development.

Section 4(f) Property

Section 4(f) of the Department of Transportation Act (recodified at 49 USC, Subtitle I, Section 303) provides that no publicly owned park, recreation area, wildlife or waterfowl refuge, or land of a historic site that is of national, state, or local significance will be used, acquired, or affected by programs or projects requiring federal assistance for implementation. Paradise Hills Park, located approximately one mile west of the Airport, is the closest park used for recreation. It is not anticipated that any of the proposed land acquisition included in the Airport Master Plan Update will result in a Section 4(f) impact.

Any proposed park or recreation improvements in the vicinity of the Airport should be coordinated with airport staff and the Federal Aviation Administration, and will be developed in a manner that is compatible with the Airport.

Hazardous Materials, Pollution Prevention, and Solid Waste

No hazardous substances and/or wastes will be generated from any development proposed in this Airport Master Plan Update. However, construction activities can generate hazardous wastes, and some construction materials constitute hazardous substances. These include fuel, oil, lubricants, paints, solvents, concrete-curing compounds, fertilizers, herbicides, and pesticides. Proper practices can be implemented, to prevent or minimize the potential for these hazardous substances to be released into the environment, and are included below.

Chemicals, petroleum-based products, and waste materials, including solid and liquid waste, should be stored in areas specifically designed to prevent discharge into storm water runoff. Areas used for storage of toxic materials should be designed with full enclosure in mind, such as the establishment of a dike around the perimeter of the storage area. Construction equipment maintenance should be performed in a designated area and, control measures, such as drip pans to contain petroleum products, should be implemented. Spills should be cleaned up immediately and disposed of properly.

Farmland

According to the *National Cooperative Soil Survey* from the Natural Resources Conservation Service (NRCS), the soils on and in the vicinity of existing airport property vary widely. The two most abundant soils located within airport property are Killpack-Badlands-Persayo complex, 3-25% slopes, saline; and Uffens fine sandy loam, 1-6% slopes. Neither of these soil types are designated prime or unique farmland. However, there are small segments of designated prime farmland of irrigated soils in pockets of land surrounded by non-prime farmland soils. Consultation with the NRCS should be conducted during the Runway 11/29 EA. If the NRCS determines that prime farmland does exist within the project area, the completion of a Farmland Impact Rating Form (Form AD-1006) will be required.

Wildlife Management

According to a document, entitled *WILDLIFE HAZARD MANAGEMENT AT AIRPORTS*, jointly prepared by the Federal Aviation Administration (FAA) and the U.S. Department of Agriculture Wildlife Services (USDA), all FAR Part 139 certificated airports are required to conduct an Ecological Study, also referred to as a Wildlife Hazard Assessment (WHA), when specific wildlife events occur at, or in the vicinity of, the Airport. These events include:

- An air carrier aircraft experiences multiple bird strikes or engine ingestion.
- An air carrier aircraft experiences a damaging collision with wildlife other than birds.
- Wildlife of a size, or in numbers capable of causing either of the previous events, is observed to have access to any airport flight pattern or aircraft movement area.

A Wildlife Hazard Assessment (WHA) was completed at Grand Junction Regional Airport in May 2008. The WHA identified hazardous wildlife and their movements, seasonal distributions, abundance, land use practices, and manmade and natural wildlife attractants in order to provide baseline data and information on potential wildlife hazards to aircraft/human safety. The WHA is the foundation of the Airport's Wildlife Hazard Management Plan (WHMP).

The purpose of the WHMP is to enhance safe aircraft operations by "recognizing the potential hazards that wildlife pose to aircraft and human lives". The WHMP addresses the Wildlife Management components required according to Code of Federal Regulations (CFR) Title 14, FAR Part §139.337 (e)(f). The WHMP involves careful examination of all aspects of arriving and departing aircraft within the airport vicinity, including potential wildlife hazards. Grand

Junction Regional Airport has intended to execute and maintain the WHMP in order to address the potential wildlife hazards on and around the Airport, as well as habitat monitoring, modification, and addressing and responding to general and potential wildlife hazards. Should any new or changing circumstances occur, CFR Title 14 FAR Part §139.337 allows the Airport to promptly update and modify the WHMP to appropriately respond to those situations.

Light Emissions and Visual Impacts

Airfield lighting and rotating beacons are the main sources of light emissions emanating from an airport. Proposed development included in this Master Plan Update is not anticipated to change the lighting or visual environment at Grand Junction Regional Airport.

Summary

On a project-specific basis, each improvement specified in this Master Plan Update, which receives federal funding or requires a change to the Airport Layout Plan, requires environmental clearance prior to implementation. The environmental documentation required to receive the clearance differs with the complexity of the project and the anticipated level of environmental impacts. This documentation can range from a Categorical Exclusion for simple projects to a full Environmental Impact Statement for projects with potentially significant impacts. The purpose of this Environmental Review chapter in the Master Plan Update is to attempt to uncover any potentially significant environmental concerns that might greatly influence the ability to implement one or more of the recommended improvement projects and determine the level of environmental documentation required.

As stated previously, the project with the greatest potential for environmental impacts is the construction of the relocated Runway 11/29, the primary runway at the Airport. However, no significant environmental concerns, which cannot be addressed or mitigated below significant thresholds, have been identified during this planning process. Environmental Assessments for both the relocated runway and relocated ATCT have been included in the capital funding plan provided in a later chapter of this study.

Plans

F. Airport Plans

MASTER PLAN UPDATE

GRAND JUNCTION

REGIONAL AIRPORT

F. Airport Plans

The plan for the future development of Grand Junction Regional Airport has evolved from an analysis of many considerations. Among these are: aviation demand forecasts and facility requirements; aircraft operational characteristics; construction phasing; environmental considerations; and, as characterized in the previously noted statement of goals, the general direction of airport development prescribed by airport management. Forecasts are utilized as a basis for planning; however, facilities are only to be constructed to meet actual demand.

Previous chapters have established and quantified the future development needs of the Airport. In this chapter, the various elements of the plan are categorically reviewed and detailed in summary and graphic format. A brief written description of the individual elements, represented in the set of Airport Plans for Grand Junction Regional Airport, is accompanied by a graphic description presented in the form of the *Airport Layout Plan*, the *Airport Airspace Drawings*, the *Inner Portion of the Approach Surface Drawings*, the *Departure Surface Drawings*, the *Terminal Area Plans*, *the Land Use Drawing*, and the *Airport Property Map*.

Airport Layout Plan

The Airport Layout Plan (ALP) is a graphic depiction of existing and ultimate airport facilities that will be required to enable the Airport to properly accommodate the forecast future demand. In addition, the ALP also provides detailed information on both airport and runway design criteria, which is necessary to define relationships with applicable standards. The following illustrations, entitled *AIRPORT LAYOUT PLAN EXISTING* and *AIRPORT LAYOUT PLAN FUTURE*, and the following paragraphs describe the major components of the future Airport Development Plan.

Runway System

The Airport's runway configuration will remain structured around two runways throughout the 20-year planning period. Runway 11/29 will remain the Airport's primary runway, but will be relocated in order to correct all non-standard conditions associated with this runway and its connector taxiways. The relocation will also separate the runways and reduce the potential for runway incursions by eliminating the Runway Visibility Zone (RVZ). The relocation of the

runway will allow construction to be phased over a number of years and allow the Airport to continue to accommodate commercial service aircraft operations during construction. The primary runway will retain its existing length and width (10,501' x 150'). The crosswind runway (Runway 4/22) will also remain at its existing length and width (5,501' x 75'), but a potential extension of the approach end of Runway 22 should continue to be protected for. An ultimate parallel commercial service runway (Runway11L/29R), as shown on historical plans for the Airport, is protected for at a standard runway/runway separation (4,300 feet) to allow for the potential of simultaneous IFR approaches. However, based on aviation activity forecasts, the implementation of this project is not anticipated during the 20-year planning period.

Another important consideration related to runway development at Grand Junction Regional Airport is the existing and planned instrument approach system.

- As recommended in previous planning studies, the approach visibility minimum to both ends of the future Runway 11/29 should be protected for ½-mile visibility minimums. This will require the installation of a Medium Intensity Approach Lighting System with Runway Alignment Indicator Light (MALSR) system on both runway ends.
- Both ends of Runway 4/22 are programmed for future non-precision GPS approach capabilities with not-lower-than ¾-mile visibility minimums.
- Both ends of the future Runway 11L/29R should be protected for ½-mile visibility minimums. This will require the installation of a MALSR system for both runway ends.

Runway Lighting and Landing Aids. The High Intensity Runway Lights (HIRLs) (edge lighting) serving Runway 11/29, and the Medium Intensity Runway Lights (MIRLs) serving Runway 4/22 should be maintained. The Precision Approach Path Indicator (PAPI) lights serving both ends of Runway 11/29 and Runway 4 should be maintained, while the Visual Approach Slope Indicator (VASI) lights serving Runway 22 should be upgraded to PAPIs. The future Runway 11L/29R is planned to be equipped with HIRLs and PAPIs. Relocation of the Instrument Landing System (ILS) components for Runway 11, including the localizer and glide slope antennas, will be required during the Runway 11/29 relocation project.

Taxiway System

Recommended taxiway system improvements include:

- Parallel Taxiway "A" will be relocated to the "crown" of the existing Runway 11/29 (600-foot separation from the new Runway 11/29).
- At least two high-speed (acute-angled) exit taxiways should be constructed to maximize the capacity of the relocated Runway 11/29.
- A taxilane running parallel to Taxiway "A" is protected for that could ultimately be extended for the entire length of Runway 11/29, providing a full dual-taxiway system.
- Relocation of parallel Taxiway "C" will be protected for; however, this is considered a low priority project.
- Additional parallel taxiways on opposite sides of each runway are protected for.
- A taxilane to serve the future general aviation development area south of Navigator's Way is protected for.

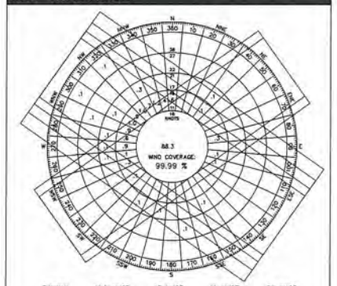
NOTES



1. This drawing reflects planning standards specific to this airport, and is not a product of detailed engineering design analysis. It is not intended to be used for construction documentation or navigation.
2. No obstacle free zone (OFZ) penetrations.
3. No threshold siting surface (TSS) penetrations.
4. The preparation of this plan was financed in part through a planning grant from the Federal Aviation Administration as provided under Section 505 of the Airport and Airway Improvement Act of 1982, as amended. The contents do not necessarily reflect the official views or policy of the FAA. Acceptance of this plan by the FAA does not in any way constitute a commitment on the part of the United States to participate in any development depicted therein nor does it indicate that the proposed development is environmentally acceptable in accordance with appropriate public laws.

NOTES

1. This drawing reflects planning standards specific to this airport, and is not a product of detailed engineering design analysis. It is not intended to be used for construction documentation or navigation.
2. No obstacle free zone (OFZ) penetrations.
3. No threshold siting surface (TSS) penetrations.
4. The preparation of this plan was financed in part through a planning grant from the Federal Aviation Administration as provided under Section 505 of the Airport and Airway Improvement Act of 1982, as amended. The contents do not necessarily reflect the official views or policy of the FAA. Acceptance of this plan by the FAA does not in any way constitute a commitment on the part of the United States to participate in any development depicted therein nor does it indicate that the proposed development is environmentally acceptable in accordance with appropriate public laws.
5. The existing fence line is based on Mapping Survey Data from Carter/Burgess Aviation Services, dated 10/16/2006. Future perimeter fencing improvements are planned in 2009 and 2011.

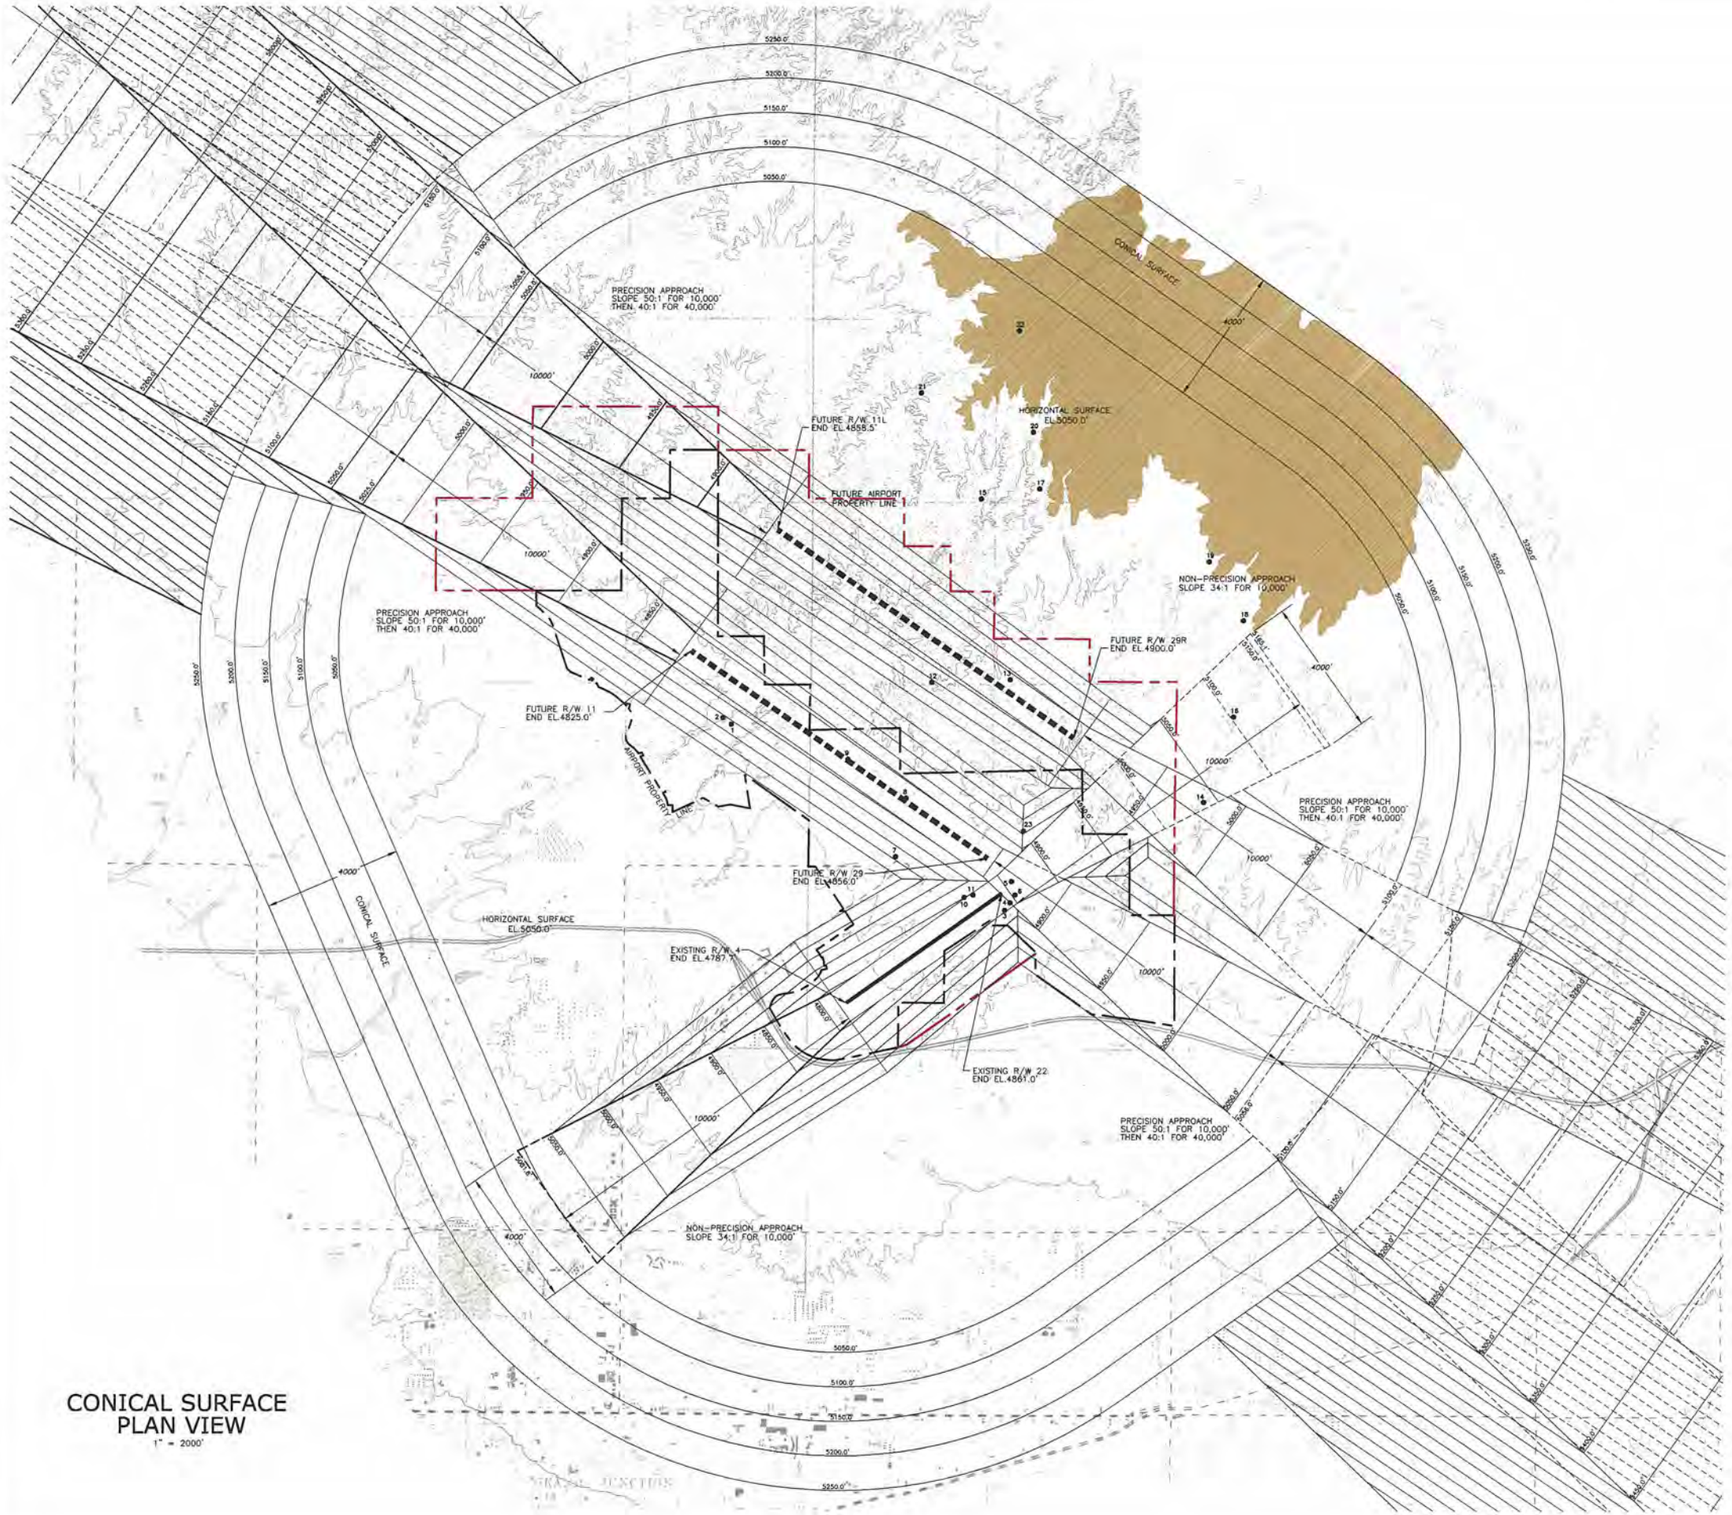
Landside Development

As discussed in the previous chapters, the ALP also allocates various development areas for landside facilities. Landside facilities include terminal facilities, aircraft parking aprons, hangars, aircraft maintenance facilities, automobile access and parking, support facilities, etc. Detailed illustrations of these landside development areas are provided in the *Terminal Area Plans* section of this chapter.

The area south and west of the runway complex at Grand Junction Regional Airport is very close to full build out with only three locations left for development including the area adjacent to connector Taxiways A1 and A2, the "infill" area between connector Taxiways A3 and A4, and the area south of Navigators Way. Shifting Runway 11/29 approximately 650 feet to the north and east will create additional landside developable area for both aircraft parking apron and aviation facilities expansion.



Passenger Terminal Area. The existing passenger terminal building is approaching capacity in various areas and consideration should be given to the space requirements to accommodate the forecast passenger demand at the Airport. Previous planning documents have introduced the potential alternative of relocating the passenger terminal and related facilities to the northwest side of Runway 11/29. However, relocating Runway 11/29 by 650 feet to the north and east would create an additional development envelope for terminal expansion. This will allow for better utilization of the significant investment the Airport has made in both vehicle parking and landside access improvements in recent years. Due to the anticipated additional space requirements of both the Transportation Security Administration (TSA) and airport administration/operations, a separate administrative office building has been included in the capital funding plan.

Airspace Plan

The Airport Airspace Drawing is based upon Federal Aviation Regulation (FAR) Part 77, *Objects Affecting Navigable Airspace*. In order to protect the Airport's airspace and approaches from hazards that could affect the safe and efficient operation of aircraft, federal criteria contained in the FAR Part 77 document have been established to provide guidance in controlling the height of objects in the vicinity of airports. FAR Part 77 criteria specify a set of imaginary surfaces, which, when penetrated, identify an object as being an obstruction.

The *AIRPORT AIRSPACE DRAWINGS*, which are illustrated in the following figures, provide plan and profile views depicting these criteria as they specifically relate to Grand Junction Regional

Airport. The plan is based on the ultimate planned runway lengths, along with the ultimate planned approaches to each runway end. For Runways 11/29 and 11L/29R, it is based on larger-than-utility criteria with a precision approach to each end of the runway. For Runway 4/22, it is based on larger-than-utility criteria with a non-precision approach to both runway ends.

Inner Portion of the Approach Surface Drawings

To provide a more detailed view of the inner portions of the Part 77 imaginary approach surfaces [the Threshold Siting Surfaces (TSS) and the Runway Protection Zone (RPZ) areas], the following drawings are provided. An RPZ is trapezoidal in shape, centered about the extended runway centerline and typically begins 200 feet beyond the end of the runway. The RPZs are safety areas within which it is desirable to clear all objects (although some uses are normally acceptable). The size of the RPZ is a function of the design aircraft and the visibility minimums associated with the runway's instrument approach capabilities.

The *INNER PORTION OF THE APPROACH SURFACE DRAWINGS*, which are depicted in the following illustrations, provide large-scale drawings with both plan and profile delineations. They are intended to facilitate identification of the roadways, utility lines, railroads, structures, and other possible obstructions that may lie within the confines of the inner approach surface area associated with each runway end. As with the *AIRPORT AIRSPACE PLANS*, the *INNER PORTION OF THE APPROACH SURFACE DRAWINGS* are based upon the ultimate planned runway length, along with the ultimate planned approaches to each runway.

Mitigation measures for identified obstructions to the Part 77 surfaces can range from obstruction lighting and marking to removal. When a penetration to a Threshold Siting Surface exists, one or more of the following actions is required:

- The object is removed or lowered to preclude penetration of applicable threshold siting surfaces;
- The threshold is displaced to preclude object penetration of applicable threshold siting surfaces, with a resulting shorter landing distance;
- The Glide Path Angle (GPA) and/or Threshold Crossing Height (TCH) is/are modified, or a combination of threshold displacement and GPA/TCH increases;
- Visibility minimums are raised; or,
- Night operations are prohibited unless the obstruction is lighted or an approved Visual Glide Slope Indicator (VGSI) is used.

1" = 20' VERTICALLY

REVISIONS

	DATE

NOTES

1. This drawing reflects planning standards specific to this airport, and is not a product of detailed engineering design analysis. It is not intended to be used for construction documentation or navigation.
2. (N) – For public, non-interstate roadways, fifteen feet (15') is added to surface elevation to determine clearance, per FAR Part 77 Criteria.

OBSTRUCTIONS

NO.	OBJECT DESCRIPTION	TOP ELEVATION	PENETRATION	SURFACE PENETRATED	PROPOSED DISPOSITION

– There are no published obstructions in this view.
– FAA AC 150/5300-13, Appendix 2, Paragraph 4.(1)(a) states that "No object should penetrate a surface beginning at the elevation of the runway at the Departure End of Runway (DER) or end of clearway, and slopes at 40:1. Penetrations by existing obstacles of 35 feet or less would not require Takeoff Distance Available (TODA) reduction or other mitigations found in paragraph 4; however, they may affect new or existing departure procedures."

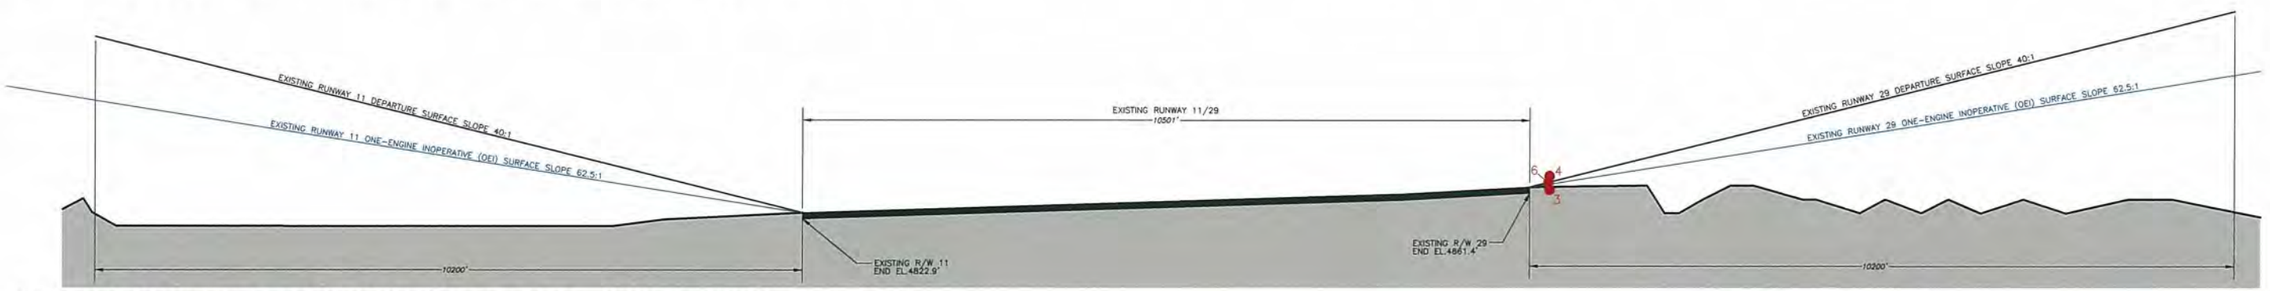
Departure Surface Drawings

The following illustrations, entitled *DEPARTURE SURFACE DRAWING EXISTING AND FUTURE RUNWAY 11/29*, and *DEPARTURE SURFACE DRAWING POST-PLANNING RUNWAY 11L/29R*, present detailed views of departure ends of these runways. The applicability of the departure surface is dependent on the designation of primary runway(s) for departure. Grand Junction Regional Airport has published departure procedures for both Runway Ends 11 and 29. Mitigation measures for identified obstructions are similar to those required for penetrations to the Threshold Siting Surfaces.



Also shown on the following illustrations is the one-engine inoperative (OEI) obstacle identification surface (OIS). According to FAA AC 150/5300-13, *Airport Design*, this surface is provided for information only and does not take effect until January 1, 2010.

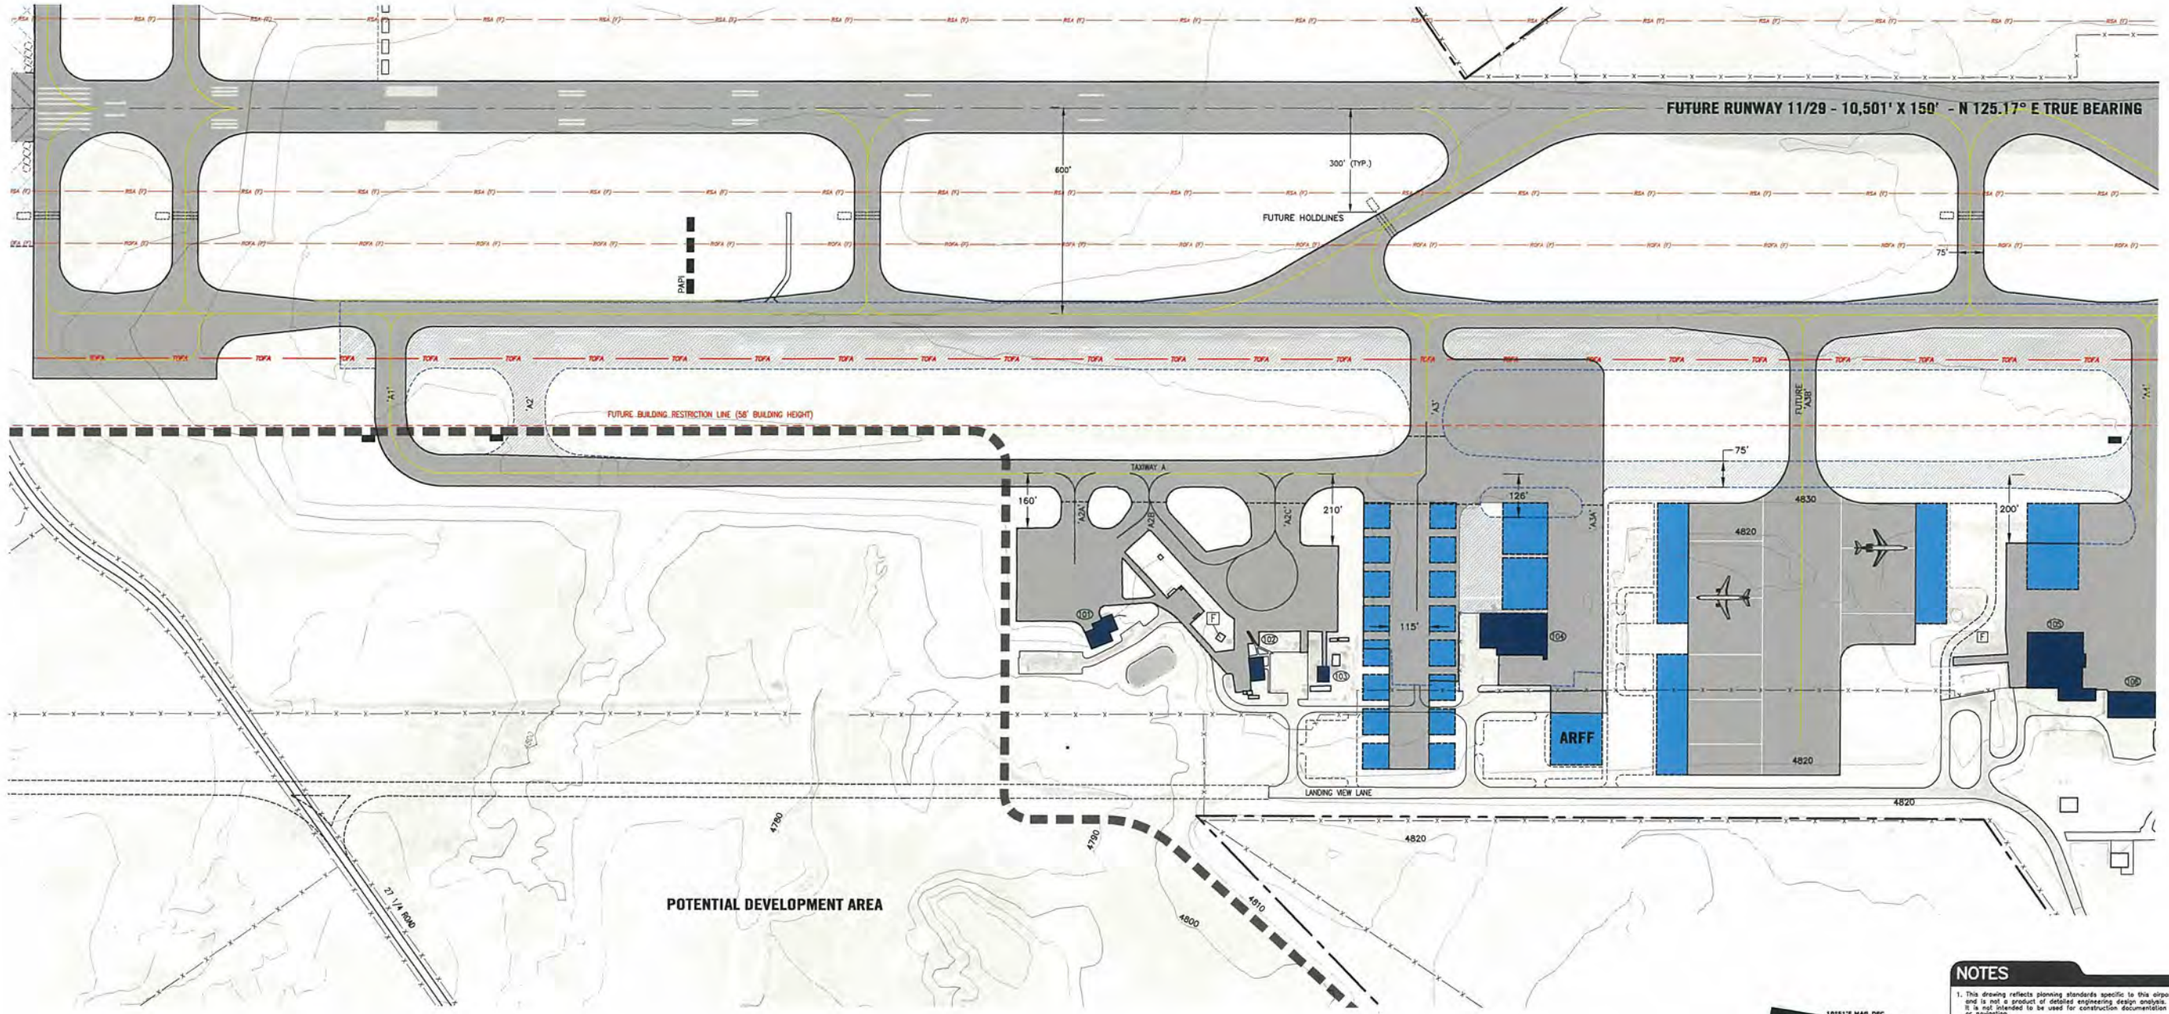
Terminal Area Plans



The following illustrations, entitled *TERMINAL AREA PLAN 1*, *TERMINAL AREA PLAN 2*, and *TERMINAL AREA PLAN 3*, present detailed views of the more intensely developed landside use areas on the Airport.

Airport Land Use Plan

The *LAND USE PLAN,* presented in the following figure, depicts existing and recommended use of all land within the ultimate airport property line and in the vicinity of the Airport [including the area contained in the future 65 day/night average sound level (DNL) noise contour]. The purpose of the on-airport portions of the *LAND USE PLAN* is to provide airport management with a guide for leasing revenue-producing areas on the Airport. The off-airport portions of the *LAND USE PLAN* provide guidance to local authorities for establishing appropriate land use zoning in the vicinity of the Airport.

Airport Property Map

The *AIRPORT PROPERTY MAP,* which is presented in the following illustration, indicates how various tracts of land within the airport boundaries were acquired (e.g., federal funds, surplus property, local funds, etc.). The purpose of the *AIRPORT PROPERTY MAP* is to provide information for analyzing the current and future aeronautical use of land acquired with federal funds.

NOTES

1. This drawing reflects planning standards specific to this airport, and is not a product of detailed engineering design analysis. It is not intended to be used for construction documentation or navigation.
2. No obstacle free zone (OFZ) penetrations.
3. No threshold siting surface (TSS) penetrations.
4. The preparation of this plan was financed in part through a planning grant from the Federal Aviation Administration as provided under Section 505 of the Airport and Airway Improvement Act of 1982, as amended. The contents do not necessarily reflect the official views or policy of the FAA. Acceptance of this plan by the FAA does not in any way constitute a commitment on the part of the United States to participate in any development depicted therein nor does it indicate that the proposed development is environmentally acceptable in accordance with appropriate public laws.
5. The existing fence line is based on Mapping Survey Data from CarterBurgess Aviation Services, dated 10/16/2008. Future perimeter fencing improvements are planned in 2009 and 2011.

Area of Influence
AN AREA SURROUNDING THE AIRPORT IMPACTED OR INFLUENCED BY PROXIMITY OF THE AIRPORT EITHER BY AIRCRAFT OVERFLIGHT, NOISE AND/OR VIBRATIONS.

Clear Zone
AREA MATCHING THE DIMENSIONS OF THE RUNWAY PROTECTION ZONE (RPZ) AS SHOWN ON THE AIRPORT LAYOUT PLAN.

Critical Zone
AREA LOCATED DIRECTLY OFF THE END OF EACH RUNWAY'S PRIMARY SURFACE (OR 200 FEET FROM THE END OF THE PAVEMENT) WHICH IS CRITICAL TO AIRCRAFT OPERATIONS.

Noise Zone
AREA WITHIN THE 65 DNL NOISE EXPOSURE CONTOUR.

SOURCE: CITY OF GRAND JUNCTION ZONING AND DEVELOPMENT CODE ADOPTED PURSUANT TO ORDINANCE NO. 3240.

Development

G. Development Program

MASTER PLAN UPDATE

GRAND JUNCTION

REGIONAL AIRPORT

G. Development Program

The long-term development program or Capital Improvement Program (CIP) for Grand Junction Regional Airport is intended to establish a strategy to fund airport improvements and maximize the potential to receive federal and state grant funds, while also establishing a financially prudent plan for improvement funding on a local level. This programming effort is a critical component of the Master Plan Update for the Federal Aviation Administration (FAA), the Colorado Division of Aeronautics, and the local sponsor (Grand Junction Regional Airport Authority). From the FAA's perspective, the CIP provides a detailed listing of projects and costs that is critical for their use in establishing priorities and budgeting expenditures at this airport, when compared with the needs of other airports. From the local sponsor's perspective, the CIP identifies improvement needs and allows budgeting/financial decisions to be made with a comprehensive understanding of financial implications. The overall concept is to maximize the opportunities to receive federal and state grants, within the context of, and in recognition of, the amount of local funds that are available for capital needs. Although the CIP will be used for programming by the FAA, there is no financial commitment for the Federal Government or the sponsor to provide funding for the CIP. If federal matching funds are unavailable for a certain project during the specified time frame, the project will almost certainly be unaffordable using only local money, and, the improvement project will not go forward until appropriate funding is available. The basic structure of the Development Program/CIP is established in this chapter, with a detailed financial analysis being provided in the next chapter (entitled *Financial Implementation Plan*).

The potential improvements necessary to accommodate the future needs of Grand Junction Regional Airport have been placed into three phases: Phase I (0-5 years), Phase II (6-10 years), and Phase III (11-20 years). The suggested program for the phasing of these projects is provided in Tables G1 and G2. The proposed improvements are illustrated graphically by time period on the Phasing Plans (see Figures G1through G3).

Implementation Schedule and Project List

Using the documentation previously presented regarding anticipated facility demands, along with preliminary engineering analysis focusing on short-term pavement rehabilitation needs and medium-term new runway needs, a list of capital improvement projects has been assembled. The projects for the first five years are listed in priority order by year. In the second and third phases (years 6-20), the projects are listed without year designators. Grand Junction Regional Airport's proposed phased Capital Improvement Program, entitled *DEVELOPMENT PROGRAM PROJECT COSTS*, is presented as Tables G1 and G2 in this chapter. It is anticipated that the project phasing will invariably be altered as local and federal priorities evolve over the coming months and years.

The details of the Development Program (including a capital improvement project list, project cost estimates, a finalized phasing list, and a financial feasibility analysis) have been formulated in consideration of comments received from airport staff, the FAA, and the Study Committee.

Cost Estimates

Cost estimates for individual projects, based on current construction unit costs, have been prepared for the improvement projects that have been identified as potentially being needed during the 20-year planning period. Some of the improvement costs listed have been escalated to include an inflation factor. Other project costs, particularly those involving Airport Improvement Program matching funds, have not been escalated. These estimates are intended to be used for planning purposes only and should not be construed as construction cost estimates, which can only be compiled following the preparation of detailed engineering design documents.

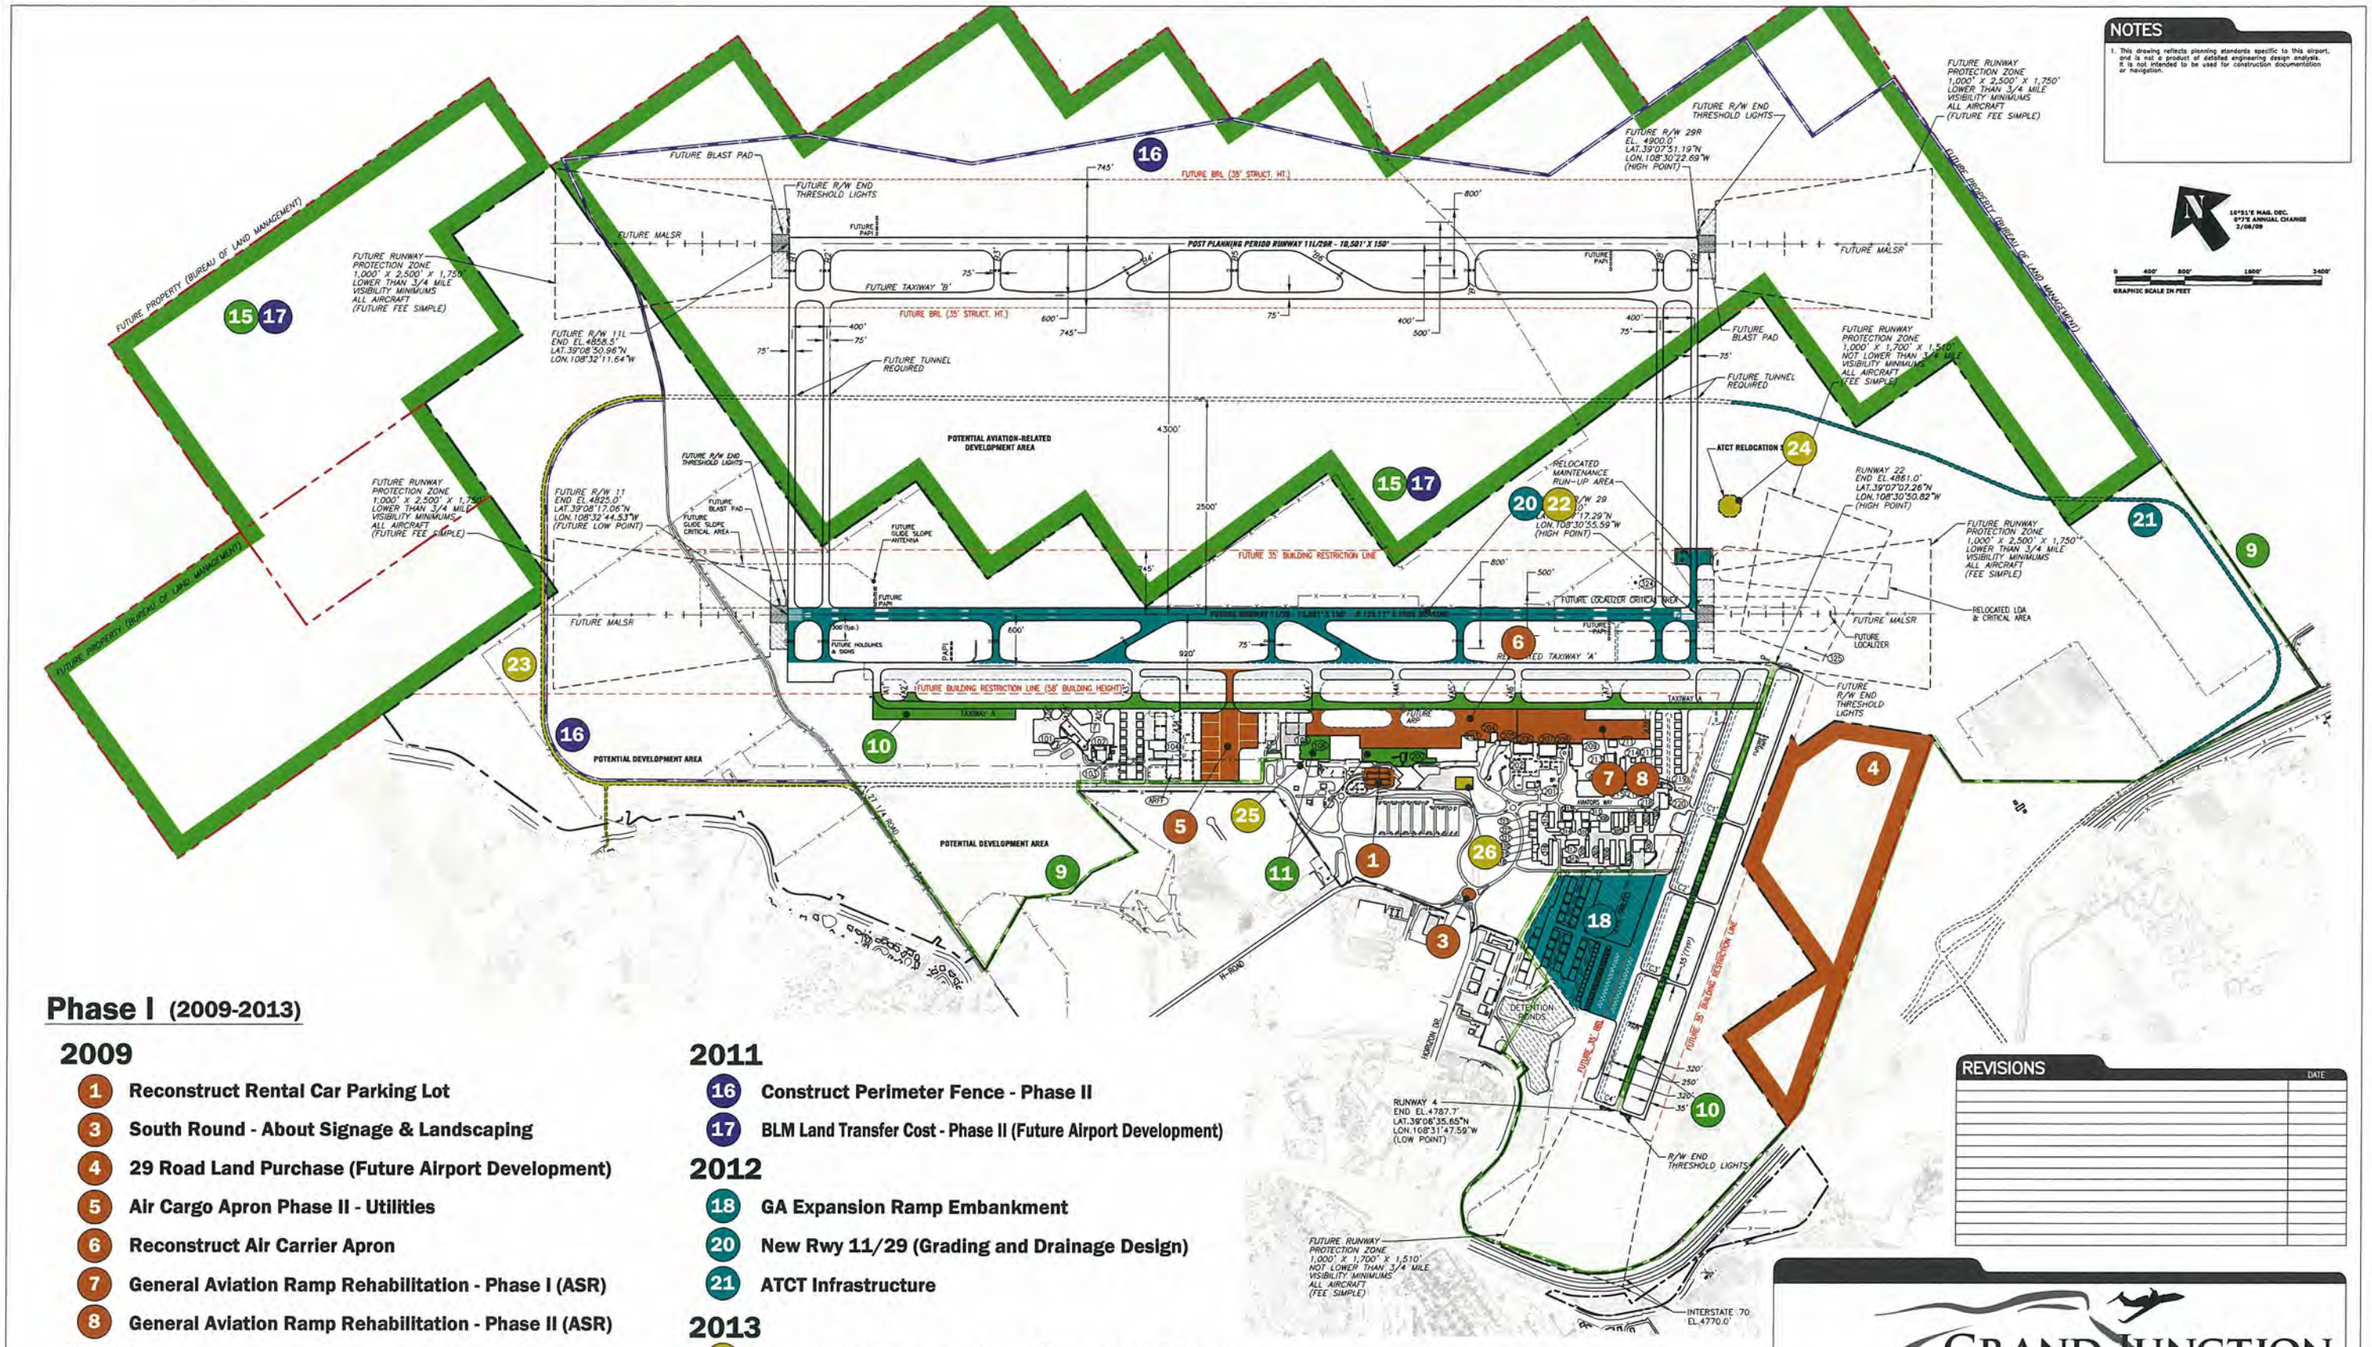
Capital Improvement Program (CIP)

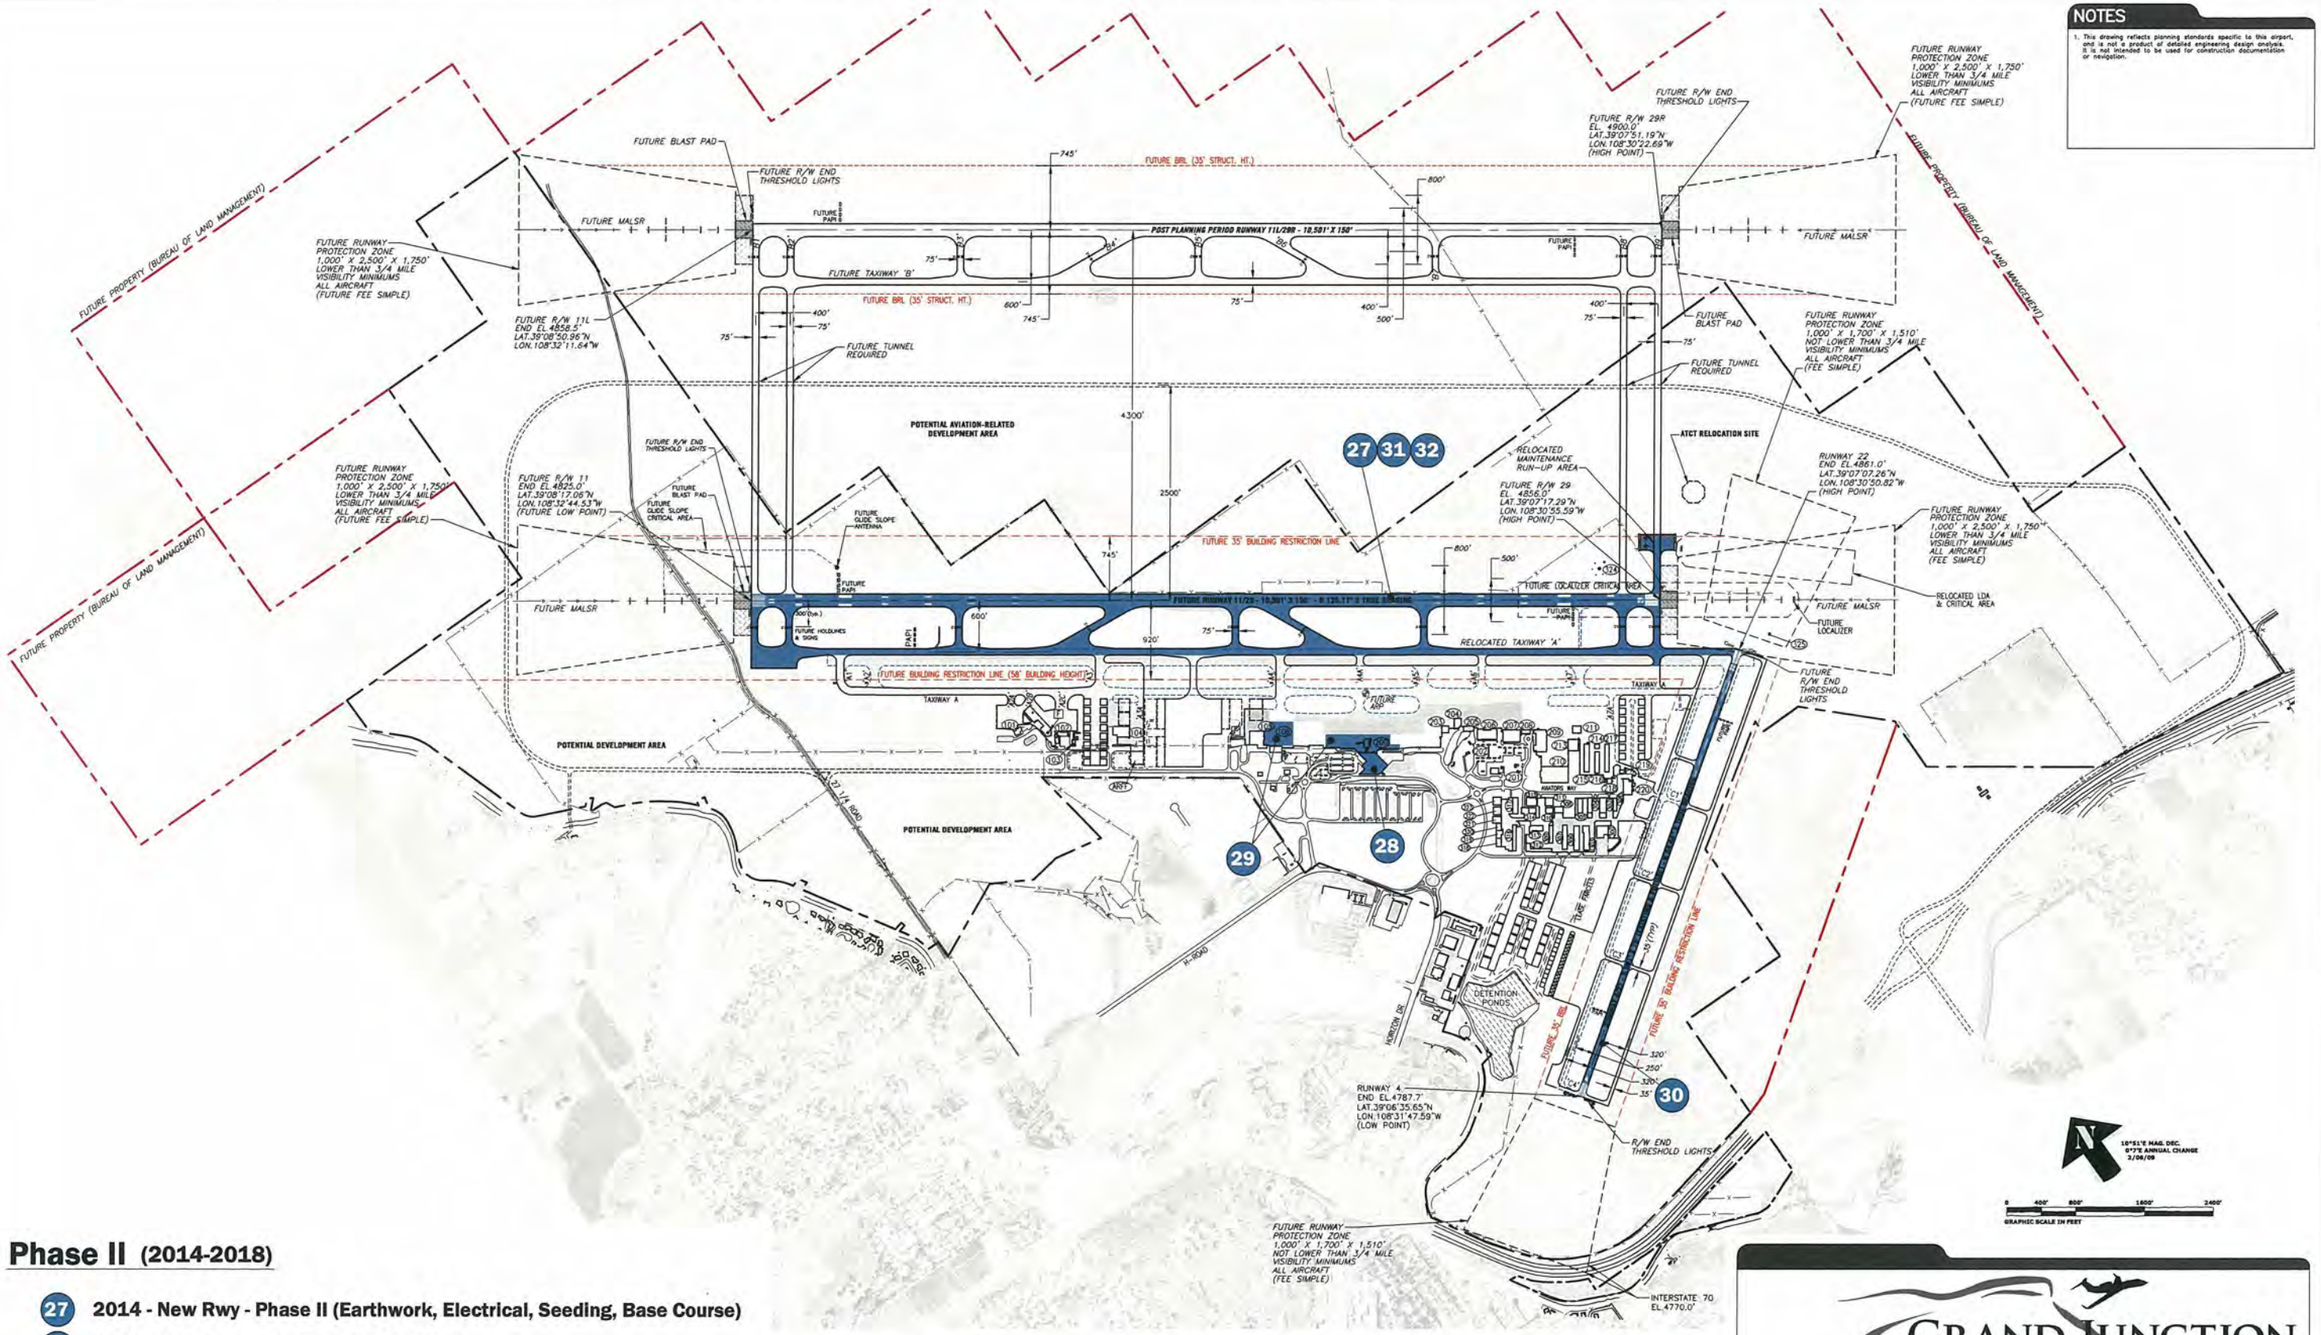
To assist in preparation of the FAA's effort to provide grant funding to the most needed projects, airport staff keeps, on file and up to date with the FAA, an Airport Capital Improvement Program (ACIP), which is similar in format to the tables presented previously. The purpose of the proposed project list, phasing, and costs is to provide a progressive projection of capital needs, which can then be utilized in local and federal financial programming. It is realized that, as soon as this long-range planning document is published, the project list starts to be out of date; therefore, it will always differ to some degree with the Airport's ACIP on file with the FAA.



Phasing Plan

To supplement the information provided by the project list and project cost estimates, phasing illustrations have been prepared. The following illustrations, entitled *PHASE I, PHASE II,* and *PHASE III*, indicate the suggested phasing for the proposed improvement projects throughout the 20-year planning period.

The plans represent a suggested schedule and variance from it may be necessary, especially during the latter time periods. Attention has been given to the first five years because the projects outlined in this time frame include many critical improvements. The demand for certain facilities, especially in the latter time frame, and the economic feasibility of their development, are to be the prime factors influencing the timing of individual project construction. Care must be taken to provide for adequate lead-time for detailed planning and construction of facilities, in order to meet aviation demands. It is also important to minimize the disruptive scheduling, where a portion of the facility may become inoperative due to construction, and to prevent extra costs resulting from improper project scheduling.



Financial Plan and Implementation Strategy

Funding sources for the Capital Improvement Program depend on many factors, including the Airport Improvement Program (AIP) project eligibility, the ultimate type and use of facilities to be developed, debt capacity of the airport, the availability of other financing sources, and the priorities for scheduling project completion. For planning purposes, assumptions were made related to the funding source of each capital improvement. The projects' costs provided in the previous tables are identified with likely funding sources. More detailed information related to capital funding sources is included in the following chapter.

Summary – Master Plan Capital Improvement Program

If aviation demands continue to indicate that improvements are needed, and, if the proposed improvements prove to be environmentally acceptable, the capital improvement financial implications discussed previously are likely to be acceptable for the FAA and the Grand Junction Regional Airport Authority. However, it must be recognized that this is only a programming analysis and not a commitment on the part of the FAA or the Airport Sponsor. If the cost of an improvement project is not financially feasible, it will not be pursued at that time.

To further refine the financial implications involved with the long-term development program and the implementation schedule, the following chapter, entitled *Financial Implementation Plan*, provides a detailed analysis of the CIP and funding strategies.

Financial

H. Financial Implementation Plan

MASTER PLAN UPDATE

GRAND JUNCTION

REGIONAL AIRPORT

H. Financial Implementation Plan

The purpose of this analysis is to evaluate Grand Junction Regional Airport's capability to fund the Master Plan Capital Improvement Program (CIP) and finance operations during the Phase I, Phase II, and Phase III planning periods of the capital program. Results of the evaluation are presented in a detailed Financial Implementation Plan that provides a basis for matching the amounts and timing of estimated capital costs with projected capital funding sources. Detailed tables of projections for the capital program, operating expenses, operating revenues, and cash flow are provided in support of the Financial Plan Summary, which presents the results of this evaluation.

Overall Approach

The overall approach for development of the Financial Implementation Plan included the following steps:

- Gathering and reviewing key Airport documents related to historical financial results, capital improvement plans, operating budgets, regulatory requirements, and Airport policies;
- Interviewing key Airport management personnel to gain an understanding of the existing operating and financial environment and overall financial management philosophy;
- Reviewing the aviation traffic forecast previously developed in the Master Plan and discussing forecast modifications with Airport management to reflect the more recent experience of actual aviation activity. For the financial analysis, the overall enplanement growth rate assumed for the planning period was 2.6% per year, which is consistent with the original Master Plan forecast;
- Reviewing the Master Plan CIP, cost estimates, and development schedule anticipated for the planning period and projecting the overall financial requirements for the program;
- Determining and analyzing the sources and timing of capital funds available to

meet the financial requirements for funding the capital program;

- Analyzing historical and budgeted operating expenses, developing operations and maintenance expense assumptions, reviewing assumptions with Airport management, and projecting future operating costs for the planning period;
- Analyzing historical and budgeted operating revenues, developing operating revenue assumptions, reviewing assumptions with Airport management, and projecting future operating revenues for the planning period; and,
- Completing results of the analysis and evaluation in a Financial Plan Summary that provides conclusions regarding the financial practicability of implementing the planned capital program.

Sources of Capital Funding

The development of the Master Plan CIP is anticipated to be funded from several sources. These sources include FAA entitlement and discretionary grants, state aviation grants, passenger facility charges (PFCs), rental car customer facility charges (CFCs), cash reserves/net operating cash flow, and other funding. Airport management has indicated that its overriding policy for funding capital projects is to identify funding sources for all projects and devise a plan to obtain these sources. If a planned funding source is not available in the nature, amount, or time frame that is needed for a project, then the project will be delayed until the funding is secured. Each identified source of funds is described in the following section.

FAA Airport Improvement Program Grants. The Airport receives grants from the Federal Aviation Administration (FAA) to finance the eligible costs of certain capital improvements. These federal grants are allocated to commercial passenger service airports through the Airport Improvement Program (AIP). AIP grants include entitlement grants, which are allocated among airports by a formula that is driven by enplanements, and discretionary grants, which are awarded in accordance with FAA guidelines. Under the current AIP re-authorization legislation, the Airport is projected to receive entitlements of $1.7 to $2.4 million per year during the 2009 through 2021 planning period based on the modified forecast of passenger enplanements. Non-Hub airports (those with annual enplanements up to about 330,000) can accumulate up to four years of unspent entitlements before the award is revoked.

The approval of AIP discretionary funding is based on a project eligibility ranking method the FAA uses to award grants, at their discretion, based on a project's priority and importance to the national airport and airway system. During the Phase I period through 2013, the Financial Plan projects discretionary grant awards totaling $30.3 million to the Airport to support a commercial

aircraft ramp, environmental assessment, perimeter fence and, most significantly, projects related to the new Runway 11/29. The FAA has indicated its support and has planned to provide significant discretionary funding for the new Runway 11/29 because replacing this runway is the most economically feasible way to remedy a number of non-standard conditions present in the existing runway. Airport management has indicated that the existing Runway 11/29 will no longer be viable or serviceable by the end of the planning period in 2021 and, thus, needs to be replaced as indicated in the CIP and supported by the FAA. Although the FAA does not commit discretionary funding in advance of project initiation, this funding represents a reasonable expectation for the plan (particularly based on the FAA's stated, although not formally committed, future support, as well as, the discretionary support already provided). It is also reasonable to assume that the Airport will receive additional discretionary funding later during the planning period for higher priority, eligible projects, such as aircraft apron improvements, taxiway relocation, and continued support of the new runway. It was assumed that an additional $74.1 million in discretionary grants ($67 million for Runway 11/29) would be provided during Phase II and an additional $9.8 million during Phase III of the planning period. If the projected discretionary funds are not available when implementation of the related projects is planned, these projects will be delayed.

The American Recovery and Reinvestment Act of 2009 (ARRA) was passed by Congress in February 2009. The ARRA specifically provides $1.1 billion in discretionary funding for capital projects administered by the FAA. The Airport has received $8.1 million in ARRA grants for rehabilitation of a general aviation aircraft apron and has been designated to receive an additional $1.5 million for this project. As indicated in the Act, 100% of project funding is provided without the requirement for local matching funds. Although not yet awarded, Airport management anticipates that additional ARRA grants of about $7.6 million will also be awarded for perimeter fencing and additional GA apron rehabilitation.

State Division of Aeronautics Grants. The Colorado Department of Transportation Division of Aeronautics provides Discretionary Aviation Grants for airport projects from a portion of the state sales tax collected on aviation fuel. Grants are approved for projects including those that are AIP eligible, aviation pavement maintenance projects, and various other aviation projects. For AIP eligible projects, state grant awards for up to 50% of an airport's local match requirement are allowed. Non-Revenue producing projects that are not AIP eligible (but are still eligible for state funding) may also receive up to 80% funding (with a 20% local match) for the total cost of approved projects. In general, a limit of about $250,000 per year in state grants is awarded to Colorado airports supported by the Division. The Master Plan CIP includes several projects during the planning period that are assumed to be partially funded from State Aeronautics Grants - $1,250,000 in Phase I; $1,250,000 in Phase II; and $445,000 in Phase III.

Passenger Facility Charges. The Aviation Safety and Capacity Expansion Act of 1990 established the authority for commercial service airports to apply to the FAA for imposing and using a Passenger Facility Charge (PFC) of up to $3.00 per enplaned passenger. With the passage of AIR-21 in June 2000, airports were permitted to apply for an increase in the PFC collection amount from $3.00 per eligible enplaned passenger to $4.50. (In 2009, a further increase to $7 is being considered by Congress in AIP re-authorization legislation. The actual outcome of this legislation is currently uncertain.) The proceeds from PFCs are eligible to be used for AIP eligible projects and for certain additional projects that preserve or enhance capacity, safety, or security; mitigate the effects of aircraft noise; or, enhance airline competition. PFCs may also be used to pay debt service on bonds (including principal, interest, and issue costs) and other indebtedness incurred to carry out eligible projects. In addition to funding future planned projects, the legislation permits airports to collect PFCs to reimburse the eligible costs of projects that began on or after November 5, 1990.

Since 1992, Grand Junction has submitted seven PFC applications that were approved by the FAA. Only applications #4 and #7 remain open with a total collection authority of $10,013,922 and a charge expiration date of approximately August 2019. As of December 2008, about $6.5 million in collection authority remained. The implementation analysis assumes that the Airport will submit additional PFC applications and amendments, as required, to ensure that the collection of PFC revenues continues beyond the current anticipated expiration date. Throughout the 13-year planning period, projected PFC revenues of $1.9 million are planned to provide partial funding for the new passenger building scheduled for implementation in 2015. Although PFC collections of about $14.3 million are projected during the planning period, the majority has already been committed to pay debt service on the previously issued Series 2007 General Airport Revenue Bonds.

Rental Car Company Customer Facility Charges. In May 2008, the Authority imposed a customer facility charge (CFC) within rental car concession agreements of $3.25 per rental car transaction day. The fee was imposed to finance and pay for the repair, planning and construction of on-Airport rental car facilities (which are indicated in the Master Plan CIP). It is the Authority's intent to cease collecting the CFC when all rental car costs (including financing costs) are recovered. During Phase I, collections of about $2.3 million are anticipated. During Phase II, collections of about $2.5 million are anticipated and, in Phase III, collections of about $1.5 million are anticipated. Projects to be funded include reconstruction of a rental car parking lot and a rental car service facility.

Other Funding. During the Phase I planning period, the Master Plan CIP includes ATCT projects (at a cost of about $13.6 million), a rental car service facility (with an estimated cost of $6

million), and an administration office building (with an estimated cost of $15 million). During Phase II, the CIP includes a new passenger terminal building with an estimated cost of $50 million. Airport management has identified future CFC revenues, PFC revenues, tenant rentals, and other funds as the funding sources for these projects. Issuing debt serviced by these funding sources may also be a consideration to finance the projects. However, with information currently available, the timing for attainment of these funds is uncertain. Consequently, the funding sources for these projects have been referenced throughout the Financial Plan as "Other Funding". In accordance with Airport management's overriding funding policy, if the "Other Funding" sources identified for the projects cannot be obtained in the time frames planned, the associated projects will be delayed until such funding can be secured.

Cash Reserves/Net Operating Cash Flow. At the beginning of 2009, the Airport had about $2.9 million in cash reserves to support operations and partially fund some projects included in the Master Plan CIP. Net operating cash flow (revenues less expenses and debt service) is anticipated to range from about $800,000 to $2.1 million per year by the end of the planning period. The Financial Plan assumes these sources of cash will contribute to fund ineligible projects, partially fund selected eligible projects, and ensure that positive year-end cash balances are maintained.

Financial Analysis and Implementation Plan for the Master Plan Capital Improvement Program

This section, along with the Tables presented at the end of the chapter, provides the analysis and results of evaluating the financial reasonableness of implementing the Master Plan Capital Improvement Program during the planning period from 2009 through 2021.

Estimated Project Costs and Development Schedule. The estimated project costs and development schedule are derived from previous results of the Master Plan development analysis. The program for capital expansion and improvement projects is projected for the Phase I planning period from the years ending 2009 through 2013, for the Phase II period from the years ending 2014 through 2018, and for the Phase III period from the years ending 2019 through 2021. For each of these planning periods, Table H1 at the end of the chapter presents the estimated timing and costs of the identified projects included in the capital program. As shown in Table H1, the total estimated cost of capital projects is $245,272,674 in 2008 dollars. The estimated costs for most of the projects scheduled during the period 2009 through 2021 are adjusted by an assumed 3.5% rate of annual inflation. Due to the uncertainty of estimated development costs for the new Runway 11/29, the rental car service facility, the administration office building, and the new passenger terminal projects, costs for these elements of the CIP were not escalated.

The resulting total escalated costs are $258,197,053. Exhibit H1 below presents a summary of Table H1 and provides a comparison of 2008 base year costs with escalated costs adjusted for inflation for each of the planning periods.

Exhibit H1

SUMMARY OF BASE YEAR AND ESCALATED COSTS FOR THE CAPITAL PROGRAM

Planning Periods	2008 Base Year Costs	Escalated Costs
Phase I Projects (2009 – 2013)	$95,911,119	$100,258,158
Phase II Projects (2014 – 2018)	$137,361,555	$140,115,302
Phase III Projects (2019 – 2021)	$12,000,000	$17,823,593
Total Project Costs	$245,272,674	$258,197,053

Source: *Leibowitz & Horton AMC Analysis.*
Note: Addition errors are due to rounding of calculated amounts and not all project costs include the inflation adjustment.

Sources and Uses of Capital Funding. As discussed in previous sections of this analysis, a variety of sources are available for funding capital improvements at the Airport. The funding structure of the capital program depends on many factors, including project eligibility for the various funding sources, the ultimate type and use of facilities to be developed, the amounts and timing of funds availability, and the priorities for scheduling project completion. For planning purposes, assumptions were made related to the funding source of each capital improvement. The detailed capital funding analysis is provided in Table H2 at the end of the chapter. A summary of the capital plan, with escalated project cost estimates and the application of funding sources, is presented in Exhibit H2 that follows.

Exhibit H2

SUMMARY OF SOURCES AND USES OF CAPITAL FUNDING

Sources of Capital Funding	Phase I (2009 – 2013)	Phase II (2014 – 2018)	Phase III (2019 - 2021)	Totals

Note: Addition errors are due to rounding of calculated amounts.

Exhibit H2 provides a summary of capital funding by source and by phase of development. It also provides a summary of the uses of capital funding by phase and by type of project to which the funding is applied. As shown in the above exhibit, a substantial amount of funding will be needed from federal sources, including $1.7 to $2.4 million per year throughout the planning period from AIP entitlement grants, $114 million in AIP discretionary grants, and $15.9 million in ARRA grants. Thus, $158 million, or 61.3%, of total funding for the 13-year Master Plan CIP is projected to come from AIP grants. State Division of Aeronautics grants are expected to provide $2.9 million, or 1.1%, of the funding. Passenger Facility Charges are expected to provide $1.9 million, or 0.7%, of the funding. Although about $14.3 million in PFC revenues

are expected to be collected during the planning period, a substantial portion of these funds have been allocated by the Authority for the payment of debt service on the previously issued Series 2007 General Airport Revenue Bonds. Customer Facility Charges (collected from the rental car companies operating at the Airport) are expected to provide $5.7 million, or 2.2%, of the funding. Other funding is needed to provide $81.2 million, or 31.5%, of the total capital funding. Cash reserves/net operating cash flow are anticipated to provide $8.2 million, or 3.2%, of the total.

As discussed previously, the availability of AIP discretionary grants is reasonably expected, but nonetheless, is not certain. If the level of discretionary funding is not available in the time frames indicated in the CIP project schedule, then specific projects to which the funding is applied may be delayed. However, it should be noted that the FAA Northwest Mountain Region has indicated its support for the new Runway 11/29 project and its plan to provide discretionary funding for a large part of the phased project. Table H2 at the end of the chapter indicates about $87 million (out of $114 million total discretionary for all CIP projects) will be needed for implementation of the new runway.

"Other Funding" has been indicated as the funding source for the ATCT projects, the rental car service facility, the administration office building in Phase I, and the new passenger terminal building currently planned for 2015 in Phase II. Specific funding sources have been planned for these projects, but the timing for obtaining the identified funding is uncertain. If this funding is not available to match the planned implementation schedule, Airport management has indicated it will delay the projects until the funding is secured.

Projected Operations and Maintenance Expenses. Operations and maintenance expense projections for the Phase I (2009-2013), the Phase II (2014-2018), and the Phase III (2019-2021) planning periods are based on the Airport's current budget, the anticipated impacts of inflation, aviation traffic increases, and the recent experience of other similarly sized airports. The Airport's accounting structure is organized into the following departments:

- Administration
- Terminal
- Airport Operations
- Aircraft Rescue and Fire Fighting (ARFF)
- Security
- Grounds & Roadways
- Buildings & Land
- Information Technology
- Fleet

Operating expense projections for Employee Benefits and Utilities are based on 2009 budgeted amounts, with growth at an assumed annual inflation rate of 5% beginning in 2010. All other expenses are based on the 2009 budget, with growth at an assumed annual inflation rate of 3.5% beginning in 2010. Descriptions of projected expenses within each department include the following categories:

- Salaries & Benefits - Salaries include full-time, part-time and overtime payroll expenses. Employee benefits include payroll taxes, retirement, health and life insurance, workers' compensation, employee recognition, clothing allowance, and other expenses.
- Materials & Supplies - This category includes expenses for office supplies, vending machine costs, tools & equipment, computer equipment, software, ARFF supplies, fuel, oil & lubricants, and other materials & supplies expenses.
- Repairs & Maintenance - This category includes the cost of maintaining buildings, equipment, and other improvements such as HVAC, boarding bridges, elevators & escalators, pavement, ATCT, airfield lighting, automobile parking lots, landscaping, telephone/communications systems, SRE, photocopy machines, and other buildings/equipment. This category also includes scheduled replacements and snow removal activities.
- Utilities - This category includes expenses for gas, electricity, water, trash removal, and sewer utilities. It also includes expenses for telephone service and cell phone service.
- Other Operating Expenses - This category includes expenses for personnel services, personnel recruiting, property/liability insurance, education & training, travel, meals, professional services, professional dues & publications, legal services, bank service charges, licenses & fees, postage & shipping, marketing, LEO services, advertising & promotions, glycol disposal, fingerprint processing, fleet allocation, IT allocation, rentals, other purchased services, and other operating expenses.

The projection of operations and maintenance expenses is provided in Table H3 at the end of the chapter. Historical expenses for the period 2006 through 2008 are provided as a comparison, with the projection period 2009 (budgeted) through 2021.

As shown in Table H3, total expenses are expected to grow from $3,979,530 budgeted for 2009 to $4,626,734 projected for 2013, with a total of $21,484,414 during the five-year Phase I period. During the five-year Phase II period, expenses are projected to total

$25,949,748 and, during the three-year Phase III period, expenses are projected to total $18,103,288. The overall growth rate of expenses during the projection period is 5.3% per year.

Table H3 also provides a comparison of the Airport's total operating expenses per enplaned passenger versus the industry average for non-hub airports. The Airport's operating expenses per enplaned passenger are projected to grow from $16.24 budgeted for 2009 to an average of $18.57 during the Phase III planning period. During the same period, the industry average for non-hub airports grows from $28.56 in 2009 to an average of $41.71 during Phase III (Source: AAAE 2003-2004 Survey of Airport Rates and Charges with inflation adjustments after 2004). This shows that operating expenses at the Airport are significantly below those of other similarly-sized airports and are projected to remain lower throughout the 13-year projection period. Beginning in 2009, this comparison indicates that the Airport is projected to operate 43% to 55% more cost efficiently than other airports of similar size and operation.

Projected Operating Revenues. Operating revenue projections for the Phase I (2009-2013), the Phase II (2014-2018), and the Phase III (2019-2021) planning periods are based on the Airport's current budget, the anticipated impacts of inflation, aviation traffic increases, and the recent experience of other similarly-sized airports. Although inflation adjustments (3.5% annually) are included in the revenue projections, it is recognized that fees and rental rates are periodically reviewed by Airport management and may be increased by more than the assumed annual inflation rate provided in this projection to reflect reasonable market rates and fully recover costs. Historical revenues for the period 2006 through 2008 are provided as a comparison with the projection period 2009 (budgeted) through 2021. Annual growth assumptions beginning in 2010 and continuing through 2021, for the revenue categories that follow, are provided below.

Airline Revenues

- Landing Fees - Projections are initially based on the 2009 budget. Beginning in 2010, fees are assumed to grow with a 3.5% annual inflation rate, plus increases in aircraft landed weight using annual growth at ½ the rate of the Master Plan forecast of passenger enplanements. This approach reflects the airlines' practice of managing increased load factors before additional flights are provided.
- Terminal Rent - Projections are based on the budget for 2009 with 3.5% annual inflation growth thereafter.

- Security Fees - Projections are based on the budget for 2009 with 3.5% annual inflation growth thereafter.
- Boarding Bridge Use Fees - Projections are based on the budget for 2009 with 3.5% annual inflation growth thereafter.
- Deicing Fees - Projections are based on the budget for 2009 with 3.5% annual inflation growth thereafter.
- Disposal Station Fees - Projections are based on the budget for 2009 with 3.5% annual inflation growth thereafter.
- Aircraft Ramp Parking Fees - Projections are based on the budget for 2009 with 3.5% annual inflation growth thereafter.
- Overtime Fees - Projections are based on the budget for 2009 with 3.5% annual inflation growth thereafter.

Non-Airline Revenues

- Other Carrier Landing Fees - Projections are initially based on the 2009 budget. Beginning in 2010, fees are assumed to grow with a 3.5% annual inflation rate, plus increases in aircraft landed weight using annual growth at ½ the rate of the Master Plan forecast of passenger enplanements.
- Fuel Flowage Fees - Based on the 2009 budget and 3.5% annual inflation, plus ½ the annual rate of forecast enplanement growth.
- State Fuel Taxes - Tax rebates based on the 2009 budget and 3.5% annual inflation, plus ½ the annual rate of forecast enplanement growth.
- Other Airfield Use Fees - Based on the 2009 budget with 3.5% annual inflation growth thereafter.
- Rental Car Concessions - Based on the 2009 budget and 3.5% annual inflation, plus the annual rate of forecast enplanement growth.
- Rental Car Space Rent - Based on the 2009 budget with 3.5% annual inflation growth thereafter.
- Rental Car Service Area Rent - Based on the 2009 budget with 3.5% annual inflation growth thereafter.
- Ground Transportation Fees - Based on the 2009 budget and 3.5% annual inflation, plus the annual rate of forecast enplanement growth.

- Parking Lot Concession Fees - Based on the 2009 budget and 3.5% annual inflation, plus the annual rate of forecast enplanement growth.
- Advertising Display Concessions - Based on the 2009 budget with 3.5% annual inflation growth thereafter.
- News/Gift Concession Fees - Based on the 2009 budget and 3.5% annual inflation, plus the annual rate of forecast enplanement growth.
- Other Retail Concession Fees - Based on the 2009 budget and 3.5% annual inflation, plus the annual rate of forecast enplanement growth.
- TSA Rent - Based on the 2009 budget with 3.5% annual inflation growth thereafter.
- Other Terminal Space Rent - Based on the 2009 budget with 3.5% annual inflation growth thereafter.
- Badge/Fingerprint Processing Fees - Based on the 2009 budget with 3.5% annual inflation growth thereafter.
- LEO Security Cost Reimbursement - Based on the 2009 budget with 3.5% annual inflation growth thereafter.
- Land Rent - Based on the 2009 budget with 3.5% annual inflation growth thereafter.
- Hangar Rent - Based on the 2009 budget with 3.5% annual inflation growth thereafter.
- Other Building Rent - Based on the 2009 budget with 3.5% annual inflation growth thereafter.
- Expense Reimbursement - Based on the 2009 budget and 3.5% annual inflation.
- Investment Earnings - Based on the 2009 budget and fixed thereafter.
- Miscellaneous Revenues - Based on the 2009 budget and 3.5% annual inflation.

The projection of operating revenues is provided in Table H4 at the end of the chapter. As shown in the Table, revenues derived from airlines are expected to grow from $1,076,010 budgeted for 2009 to $1,257,094 projected for 2013, with a total of $5,823,741 during the five-year Phase I period. During the five-year Phase II period, airline revenues are projected to total $7,077,086 and, during the three-year Phase III period, these revenues are projected to total $4,961,029. Revenues derived from non-airline sources are expected to grow from

$3,691,873 budgeted for 2009 to $4,534,048 projected for 2013, with a total of $20,507,747 during the five-year Phase I period. During the five-year Phase II period, non-airline revenues are projected to total $26,562,860 and, during the three-year Phase III period, these revenues are projected to total $19,612,684. Total Airport revenues are expected to grow from $4,767,883 budgeted for 2009 to $5,791,142 projected for 2013, with a total of $26,331,488 during the five-year Phase I period. During the five-year Phase II period, revenues are projected to total $33,639,945 and, during the three-year Phase III period, revenues are projected to total $24,573,712. During the 13-year planning period, the overall annual growth rate for total Airport revenues is 4.8%.

Table H4 also provides a comparison of the Airport's airline cost per enplaned passenger versus the industry average for non-hub airports. The airline cost per enplaned passenger (airline fees and rentals divided by enplaned passengers) is a measure airlines use to compare their cost of operations among the airports they serve. The Airport's airline cost per enplaned passenger is projected to grow from $4.39 in 2009 to an average of $5.09 during the Phase III planning period. During the same period, the industry average for non-hub airports grows from $7.55 in 2009 to an average of $11.03 during Phase III (Source: AAAE 2003-2004 Survey of Airport Rates and Charges with inflation adjustments after 2004). This result shows that current airline rates and charges at the Airport are substantially below industry averages (41%-54% lower) and are projected to remain so throughout the planning period. (It should be noted that the AAAE survey for non-hubs includes airports with enplanements up to about 330,000 per year. Airports with higher enplanement levels have more leverage to negotiate higher airline rates. Other non-hub airports with lower enplanement levels similar to Grand Junction - about 212,000 in 2008 - also report airline costs per enplaned passenger that are lower than the non-hub averages.) In the future, if airline rates can be adjusted to more closely reflect the cost of providing airport facilities and services, an additional source of capital funding would be generated. However, the current financial weakness in the airline industry effectively precludes any substantive increase in airline rates and charges. Nonetheless, the Airport could consider conducting a Rates and Charges Study that would result in providing guidance for setting future airline rates that could eventually support the Airport's ability to collect the full cost of providing facilities for the airlines' use.

Table H4 also provides a comparison of the Airport's total operating revenue per enplaned passenger versus the industry average for non-hub airports. The Airport's operating revenue per enplaned passenger is projected to grow from $19.46 budgeted for 2009 to an average of $25.20 during the Phase III planning period. During the same period, the industry average for non-hub airports grows from $21.16 in 2009 to an average of $30.90 during Phase III

(Source: AAAE 2003-2004 Survey of Airport Rates and Charges with adjustments for inflation after 2004). This comparison shows that total Airport revenues range from about 8%-18% below those of other similarly-sized airports during the planning period. This projected shortfall is caused primarily by lower revenues derived from airline sources. Total non-airline revenues appear to currently reflect reasonably competitive levels and provide an offset to relatively lower airline rates. If a Rates and Charges Study is conducted by the Airport, it will provide a more detailed analysis of non-airline rates in addition to airline rates.

Financial Plan Summary. The Financial Plan Summary presented in Table H5 at the end of the chapter includes projection totals for operating revenues, operating expenses, capital expenditures, capital funding, and cash flow that result from the projections previously presented.

In previous sections of this analysis, Table H1 provided a practical approach for scheduling capital expenditures to match the availability of capital financing. Table H2 provided a practical approach for matching specific capital funding sources with each of the scheduled projects. Based on the assumptions underlying the Financial Implementation Plan summarized in Table H5, implementation of the Master Plan CIP is financially practicable subject to the availability of AIP discretionary grant awards and acquisition of other funding described in the analysis.

Key assumptions supporting the financial plan relate to the availability and timeliness of the funding sources that have been indicated. Continuation of the AIP entitlement program at authorized funding levels is essential. Funding levels enacted with AIR-21 in June 2000 resulted in a doubling of entitlement grants from previous years with the provision that Congress continue to appropriate at least $3.2 billion in AIP funds annually. If future appropriations fall below $3.2 billion, entitlement grants will revert to the pre-2000 levels. Receiving AIP discretionary grants of $30.3 million during Phase I, $74.1 million during Phase II, and $9.8 million during Phase III (as indicated in Table H2) is key to the financial feasibility of implementing these projects. Without this level of discretionary funding, these projects would have to be delayed until the funds could be acquired.

As discussed in previous sections of this analysis, "Other Funding" sources have been identified and are planned to provide $33.1 million in Phase I and $48.1 million in Phase II of the CIP. In accordance with Airport management's overriding funding policy, if the "Other Funding" sources identified for projects cannot be obtained in the time frames planned, the associated projects will be delayed until such funding can be secured.

Additionally, the Financial Implementation Plan relies on achievement of the Master Plan forecasts of aviation activity. Actual aviation traffic may temporarily vary from the projected levels of activity without a significant adverse impact on the capital program. If decreased traffic levels occur and persist, implementation of all the proposed projects may not be financially feasible. It should also be noted, however, that if the forecast activity levels are not met, then a number of the planned capital improvements may not be necessary.

Financial Plan Tables

Tables H1 through H5, which provide the detailed financial analysis for implementation of the Master Plan CIP, are provided on the following pages.

GRAND JUNCTION REGIONAL AIRPORT
Grand Junction, CO

ENGINEER'S CERTIFICATION

I hereby certify that this *Master Drainage Report* (plan) for the design of the Master Plan for the Grand Junction Regional Airport was prepared by me (or under my direct supervision) in accordance with the provisions of the *Stormwater Management Manual* for the owners thereof. I understand that the City of Grand Junction does not and will not assume liability for drainage facilities designed by others.

_____

Mark J. Lovato, P.E.
State of Colorado No. 35184
(Affix Seal)

OWNER'S CERTIFICATION

The Grand Junction Regional Airport Authority hereby certifies that the drainage facilities for the Grand Junction Regional Airport shall be constructed according to the design presented in this report. We understand that the City of Grand Junction does not and will not assume liability for the drainage facilities designed and/or certified by our engineer. We understand that the City of Grand Junction reviews drainage plans but cannot, on behalf of the Grand Junction Regional Airport, guarantee that final drainage design review will absolve the Grand Junction Regional Airport Authority and/or their successors and/or assigns of future liability for improper design. We further understand that approval of the Master Plan does not imply approval of our engineer's drainage design.

I. INTRODUCTION

A. Background

The Grand Junction Regional Airport is in the process of updating their Airport Master Plan for the Federal Aviation Administration (FAA). As part of the Airport Master Plan Update, improvements to various roadways are proposed to provide improved circulation and connectivity around the airport, including improvements to Landing View Lane, 27 ¼ Road, and I Road, among others. In addition, various development areas will be added, expanded, or relocated. The improved roadways and development areas will have an effect on existing drainage patterns, basins, and peak flow rates. Traffic circulation patterns and counts will also be affected. Utilities will need to be relocated and/or added as a result of the proposed improvements, as shown on the Conceptual Airport Development Plan.

B. Project Location

This project is located at the Grand Junction Regional Airport (see Vicinity Map in Appendix A). The airport is located northeast of the City of Grand Junction, CO in Mesa County, north of Interstate Highway I-70 approximately one mile along Horizon Drive. The airport is bordered by Bureau of Land Management (BLM) property to the north and east, I-70 and the Government Highline Canal to the south and Road 27 ¼ to the west.

The area studied in this report includes land in Sections 12, 13, 24, 25 and 36 of Township 1 North, Range 1 West of the UTE Meridian and in Sections 3-10, 15-21 and 29-32 of Township 1 North, Range 1 East of the UTE Meridian.

C. Property Description

The property is made up of Commercial and General Aviation areas that utilize the airport for business. The land consists of runways, taxiways, aprons, parking lots, buildings, roadway network and utility infrastructure to serve the operations at the airport.

D. Previous Investigations

There have been two recent drainage reports generated for the areas on and near the airport prior to this report. The first was a Conditional Letter of Map Revision (CLOMR) created by ICON Engineering, Inc. (ref. 2) that analyzed the Corcoran Wash, Indian Wash, Ranchman's Ditch and Leach Creek. This report created sub-basins for the entire area for use with HEC-1 software. The purpose of this report was to request a Conditional Letter of Map Revision (CLOMR) to the Flood Insurance Study (FIS) and Flood Insurance Rate Map (FIRM) for the City of Grand Junction, Mesa

County, CO. The report proposed modifications to the flood hazard information along the Horizon Drive Channel (referred to as Ranchman's Ditch), Leach Creek, and North Leach Creek.

The second report was prepared by Carter & Burgess, Inc. (ref. 3) for the development of a new parking lot and access road system for the airport (Landside Improvements Project). The report used the ICON Engineering, Inc. HEC-1 model with a few modifications for the impervious areas created by the proposed facilities. Additional detention and water quality ponds were included into the new model and areas outside the core (Ranchman's Ditch/Landside Improvements Project) were eliminated from the model.

II. DRAINAGE SYSTEM DESCRIPTION

A. Existing Drainage Conditions

The existing basins which convey drainage through the airport are Corcoran Wash, Indian Wash, Ranchman's Ditch and Leach Creek. These basins are mostly undeveloped north of the airport.

ICON Engineering, Inc analyzed an existing large dam in the Leach Creek basin that detains approximately 167 acre-feet of water and reduces the amount of flow that is conveyed around the west side of the airport. An additional detention pond was designed with the ICON Engineering, Inc. report along the southern edge of the basin to detain an additional 13 acre feet of runoff. These detention ponds have not been constructed at the time of this report and the flows for these basins should only be compared between Jviation Current Conditions and Proposed Conditions.

Ranchman's Ditch is an existing basin that conveys flows through the airport in a system of channels along the north side of the runway and into a new detention pond (WF_PD1) built with the Landside Improvements Project. This detention pond then conveys flows through a system of storm sewer pipes south under the Runway 11/29, aprons and parking lot to another new detention pond (WF_PD2) installed with the Landside Improvements Project south of the airport. This pond then conveys flows to the existing city system to the south.

There is a large dam in the Indian Wash basin that detains 128 acre-feet of water and reduces the amount of flow that is conveyed around the east side of the airport. Several stock dams are also located in the Indian Wash basin and reduce existing flows.

The Corcoran Wash basin is an existing basin that conveys flows through airport property on the west end of the airport that is planned to be acquired in the future. At this time, the area will not be developed with the Master Plan. The property is only being acquired to ensure airport safety and protections zones are accounted for.

B. Master Drainage Plan

The Master Drainage plan for the airport is to develop several new detention facilities to account for areas of development and new roadway systems. These detention ponds are shown on the Grand Junction Airport Master Drainage Existing/Proposed Basin Map (Appendix D). The basins for the Master Drainage study have been associated to the areas that were determined in the ICON report.

C. Offsite Tributary Area

Leach Creek is a large, mostly undeveloped basin that conveys about 8,000 acres of BLM land around the west side of the airport. The Master Plan shows some development in the southern portions of this basin near the west end of the airport.

Indian Wash is a large, mostly undeveloped basin that conveys about 6,000 acres of BLM land around the east side of the airport. The Master Plan shows some development in the southern portions of this basin near the southeast edge of the airport.

Corcoran Wash is a large offsite basin that conveys flows through a small area of land that is planned to be acquired by the airport for runway safety areas/protection zones. Future development is not planned for this area and the existing drainage conveyance will not change.

D. Proposed Drainage System Description

The Grand Junction Regional Airport Master drainage study is divided into four major basins; 1. Ranchman's Ditch, 2. Leach Creek, 3. Corcoran Wash and 4. Indian Wash.

Ranchman's Creek is subdivided into nineteen subbasins and is the main basin that conveys flows through the airport. Subbasin DB21 is north of Runway 11/29 and is comprised of 97.2 acres that conveys flows to an existing detention pond (PD A). Subbasin DB21a is comprised of 217.8 acres that conveys flows to an existing detention pond (WF_PD1) built with the Landside Improvements Project. Subbasin DB23b is comprised of 37.4 acres of runway, taxiway and apron area and coveys flow to an existing 3 foot diameter pipe. Subbasin DB23c is comprises of 50.1 acres of runway, taxiway and apron area that conveys flow to an existing detention pond (WF_PD2). Subbasin DB23d is comprised of 11.1 acres of parking lot and also conveys flows to detention pond (WF_PD2). Subbasin DB23e is comprised of 45.5 acres and conveys flows to an existing detention pond (R_PDU). Subbasin DB23a is comprised of 12.5 acres of area that is planned to be developed and conveys flow to an existing 4 foot diameter pipe. Subbasin DB22 is comprised of 142.5 acres of undeveloped land north of Runway 11/29 and conveys flow to an existing 4 foot diameter pipe. Subbasin DB24a is comprised of 13.6 acres of land adjacent to Runway 4/22 and conveys flows to an existing 4.5 foot diameter pipe. Subbasin DB24 is comprised of 148.4 acres of land that is planned to be developed and conveys flow to an existing detention pond (R_PDL). Subbasin

DB25a is comprised of 20.2 acres of mostly undeveloped land that conveys flows to detention pond (R_PDL). Subbasin DB25 is comprised of 15.6 acres of land adjacent to Runway 4/22. Subbasin R16 is comprised of 99.2 acres that conveys flow to a trapezoidal channel and then off-site. Subbasin R14a is comprised of 25.2 acres of land adjacent to Runway 4/22 and also conveys flow to detention pond (R_PDL). Subbasin R17 is comprised of 103.9 acres of undeveloped land north of Runway 11/29 and conveys flows to a proposed detention pond (R17). This pond is planned to detain approximately 2.0 acre-feet of water to help reduce the amount of flow through the airport after development. Subbasin R15 is comprised of 191.6 acres of runway, taxiway, apron, and parking lot uses that conveys flow offsite. Subbasin R13 is an off-site basin comprised of 27.2 acres of mostly undeveloped land. Subbasin R14 is comprised of 38.5 acres of mostly developed land that conveys flow to a trapezoidal channel off-site. Subbasin R5 is an individual basin on the south end of Runway 4/22 that conveys flow off-site.

Leach Creek is subdivided into eight subbasins and conveys flows around the west side of Runway 11/29. Subbasin L11b is comprised of 4785.0 acres of mostly undeveloped land and conveys flow to an existing major detention pond (RL11bU). Subbasin L11au is comprised of 645.8 acres of mostly undeveloped land and conveys flows to a proposed detention pond (RLOWER). Subbasin L11ad is comprised of 11.1 acres of land and conveys flow off-site. Subbasin L10u is a new split basin comprised of 236.4 acres of undeveloped land that conveys flow to a proposed detention pond (R_L10u). Subbasin L10d is a new split basin comprised of 393.0 acres of land planned to have some development in the future. Subbasin L9.1u is a new spilt basin comprised of 1523.6 acres of undeveloped land that conveys flow to a new storm drainage system south a proposed detention pond (R_L9.1). Subbasin L9.1d is a new spilt basin comprised of 217.8 acres of land planned to have some development in the future. Subbasin L9.1d also conveys flows to a proposed detention pond (R_L9.1). Subbasin L9 is comprised of 131.3 acres of mostly undeveloped land that conveys flows off-site.

Indian Wash is subdivided into nine subbasins and conveys flows around the east side of Runway 11/29. Subbasin I5 is comprised of 511.6 acres of undeveloped land that conveys flows to an existing stock dam (R_I5). Subbasin I4 is comprised of 776.3 acres of undeveloped land that conveys flows along with I3, which is made up of 2051.6 acres of undeveloped land, to an existing trapezoidal channel then onto an existing dam (R_I2). Subbasin I2 is comprised of 622.6 acres of mostly undeveloped land that conveys flow to the existing dam (R_I2). Subbasin I1 is comprised of 484.0 acres of mostly undeveloped land that conveys flows to a proposed detention pond (R_I1). Subbasin I7 is comprised of 656.5 acres of undeveloped land that conveys flows to an existing stock dam (R_I7). Subbasin I6 is comprised of 288.8 acres of land that is planned to be developed in the future and will convey flow to a proposed detention pond (R_I6). Subbasin I8 is comprised of 265.4 acres of mostly undeveloped land that will convey flow off-site. Subbasin I9 is comprised of 435.7 acres of undeveloped land that will not be modified with future development of the airport.

E. Drainage Facility Maintenance

Drainage facility maintenance for all detention ponds on the property of the Grand Junction Regional Airport will be the responsibility of the airport. After final development areas are determined and detention ponds are designed, a maintenance plan shall be created by the airport.

III. DRAINAGE ANALYSIS AND DESIGN CRITERIA

A. Regulations

The regulation for analysis for this study was the City of Grand Junction Stormwater Management Manual (ref. 4). Additional guidance was provided by the Urban Storm Drainage – Criteria Manual (ref. 1).

There are several methods used to determine the values used with HEC-1 for the characteristic of each basin, the SCS Curve Number Method, the Green and Ampt Method and the Snyder Method. These methods were computed in the analysis of this report. According to the City of Grand Junction Stormwater Management Manual "Typical values for Green-Ampt parameters were obtained from the *Drainage Manual for Maricopa County Hydrology* (Maricopa County 2003 (draft))", this procedure was also calculated with this report. The Green-Ampt values produced with the Maricopa method were significantly different than those produced by the ICON analysis. In discussions with the City of Grand Junction Development Engineer, Rick Dorris, PE, CFM, it was determined to use the Green-Ampt and SCS Method similar to how ICON Engineering, Inc. used in their prior study. It was decided that these values used in conjunction with HEC-1 would produce basin characteristics that are compatible to this region.

After reviewing the ICON/C&B HEC-1 models it was determined that the Curve Numbers (CN) and Imperviousness (I) for each subbasin were slightly different than what was generated within Jviation's report for the same areas. These differences can be seen in the SOIL DATA INPUT – CURRENT CONDITIONS, SCS Runoff Curve Number Method spreadsheet located in Appendix B.

The final procedure used to determine the input values for HEC-1 was as follows:
Each subbasin was divided into separate areas by soil type (see web soil survey in Appendix A). A Curve Number (CN) is then derived based on the soil type and imperviousness of each basin. The Initial Loss (IA) is then determined using the SCS Method.

The SCS Method uses a CN value calculated directly from the Imperviousness and soil type:

$$S = (1{,}000/CN)-10$$
$$IA = 0.2*S$$
$$Q = (P - IA)^2/((P-IA)+S$$

The values for precipitation losses, Volume Moisture Deficit (DTHETA), Wetting Front Suction (PSIF) and Hydraulic Conductivity (XKSAT) are selected from Table A1 – Table of Correspondence (see Appendix A) based on the Curve Number (CN).

The Snyder Method is then used to determine lag time (T_{lag}) and the coefficient related to peak rate of runoff (C_P):

$$T_{lag} = Ct\,(L x L_{ca}/S^{0.5})^{0.48}$$
$$C_p = PC_tA^{0.15}$$

A table with the final input values used with the HEC-1 model can be found in Appendix B.

B. Development Criteria

The development of the Grand Junction Regional Airport will be based on the Master Plan created for the FAA and the City of Grand Junction. An airport master plan is a comprehensive study of an airport and usually describes the short-, medium-, and long-term development plans to meet future aviation demand. The goal of a master plan is to provide the framework needed to guide future airport development that will cost-effectively satisfy aviation demand, while considering potential environmental and socioeconomic impacts.

C. Hydrologic Criteria

The two design storms analyzed in this study are the 10-year and 100-year design storms. Both storms are compared to the existing flow data provided by the ICON Engineering, Inc. and Carter & Burgess, Inc. reports. The existing HEC-1 model is compared to each study and the data is presented in Appendix B.

Rainfall intensities are obtained from the City of Grand Junction Stormwater Management Manual, Table 602 – Point Rainfall Values for the Leach Creek/Horizon Drive Watershed. The Depth Area Curves (Figure 614, Appendix A) where utilized with 24-Hour Storm, NRCS Type II Rainfall Distribution to generate rainfall depths and runoff.

The routing of the HEC-1 models was compared with the ICON Engineering, Inc. and Carter & Burgess, Inc. routing maps using the software Graphical HEC-1 (see Appendix B). The output shows the routing of the HEC-1 input data. Additional information was added to these routing maps for clarification.

The soil types for the airport and the off-site tributary areas are made up of Type B, Type C and Type D soils (see web soil survey in Appendix A).

This report reviews the flows and detention requirements developed with the ICON Engineering, Inc. and Carter & Burgess, Inc. drainage reports and compares them to the flows generated by the HEC-1 model prepared by Jviation, Inc. The analysis found that the flows for the undeveloped land were 10-20% higher and the flows on the developed land were 10-20% lower. After developing the model for the current and proposed conditions per the soil types and imperviousness of each subbasin all the models were compared to ensure that the flows off-site did not increase. The critical design points that convey flow off-site are as follows:

Comparison Table of Critical Design Points

Design Point	ICON/C&B-Current Conditions		Jviation-Current Conditions		Jviation-Proposed Conditions	
	10-Year	100-Year	10-Year	100-Year	10-Year	100-Year
C_L9M	260 cfs	645 cfs	265 cfs	1,493 cfs	202 cfs	1,370 cfs
C_14a	83 cfs	177 cfs	126 cfs	226 cfs	127 cfs	227 cfs
R15	50 cfs	165 cfs	53 cfs	167 cfs	84 cfs	208 cfs
R13	51 cfs	175 cfs	80 cfs	258 cfs	88 cfs	228 cfs
R_I1	N/A	N/A	24 cfs	75 cfs	21 cfs	64 cfs
R_I6	N/A	N/A	41 cfs	206 cfs	40 cfs	173 cfs
C3	N/A	N/A	31 cfs	196 cfs	31 cfs	196 cfs
R5	N/A	N/A	3 cfs	13 cfs	3 cfs	13 cfs
I8	N/A	N/A	5 cfs	116 cfs	21 cfs	141 cfs
I9	N/A	N/A	30 cfs	140 cfs	30 cfs	140 cfs

As the above table represents the allowable release rates for the detention ponds are based on comparing Jviation, Inc. current conditions to proposed conditions. This is done to ensure that the detention ponds are sized to detain the difference between current flows and proposed flows for similar models. The ICON Engineering, Inc. model is used for reference and order of magnitude for the major basins. Due to the differences in the Curve Numbers (CN) used in the different models the flows are higher in the Jviation, Inc. model. Again, to provide similar size detention ponds as in the ICON Engineering, Inc. report, the volume of water that is required to be detained is based on similar models.

As shown, the new detention pond for the Leach Creek Basin (R_L9.1) may be able to be reduced after final development areas and exact routing is determined.

Also, subbasin I8 may require a detention pond to reduce proposed developed flows, after a final development plan is completed for that area.

D. Hydraulic Criteria

The existing storm sewer system was verified using AutoCAD Civil 3D Land Desktop. Pipe flow calculations were calculated using the Manning Formula shown below:

$$V = (1/n)*R^{2/3}*S^{1/2}$$

Where:
V = mean flow rate (ft/s)
R = hydraulic radius (ft)
S = slope of hydraulic gradeline (ft/ft)
n = Manning's roughness coefficient

E. Variance from Criteria

In discussions with the City of Grand Junction Development Engineer, Rick Dorris, PE, CFM it was determined to use the Green-Ampt and SCS Method similar to how ICON Engineering, Inc. used in their prior study. This is a variance from the Maricopa Method as stated in the Stormwater Management Manual.

IV. CONCLUSION

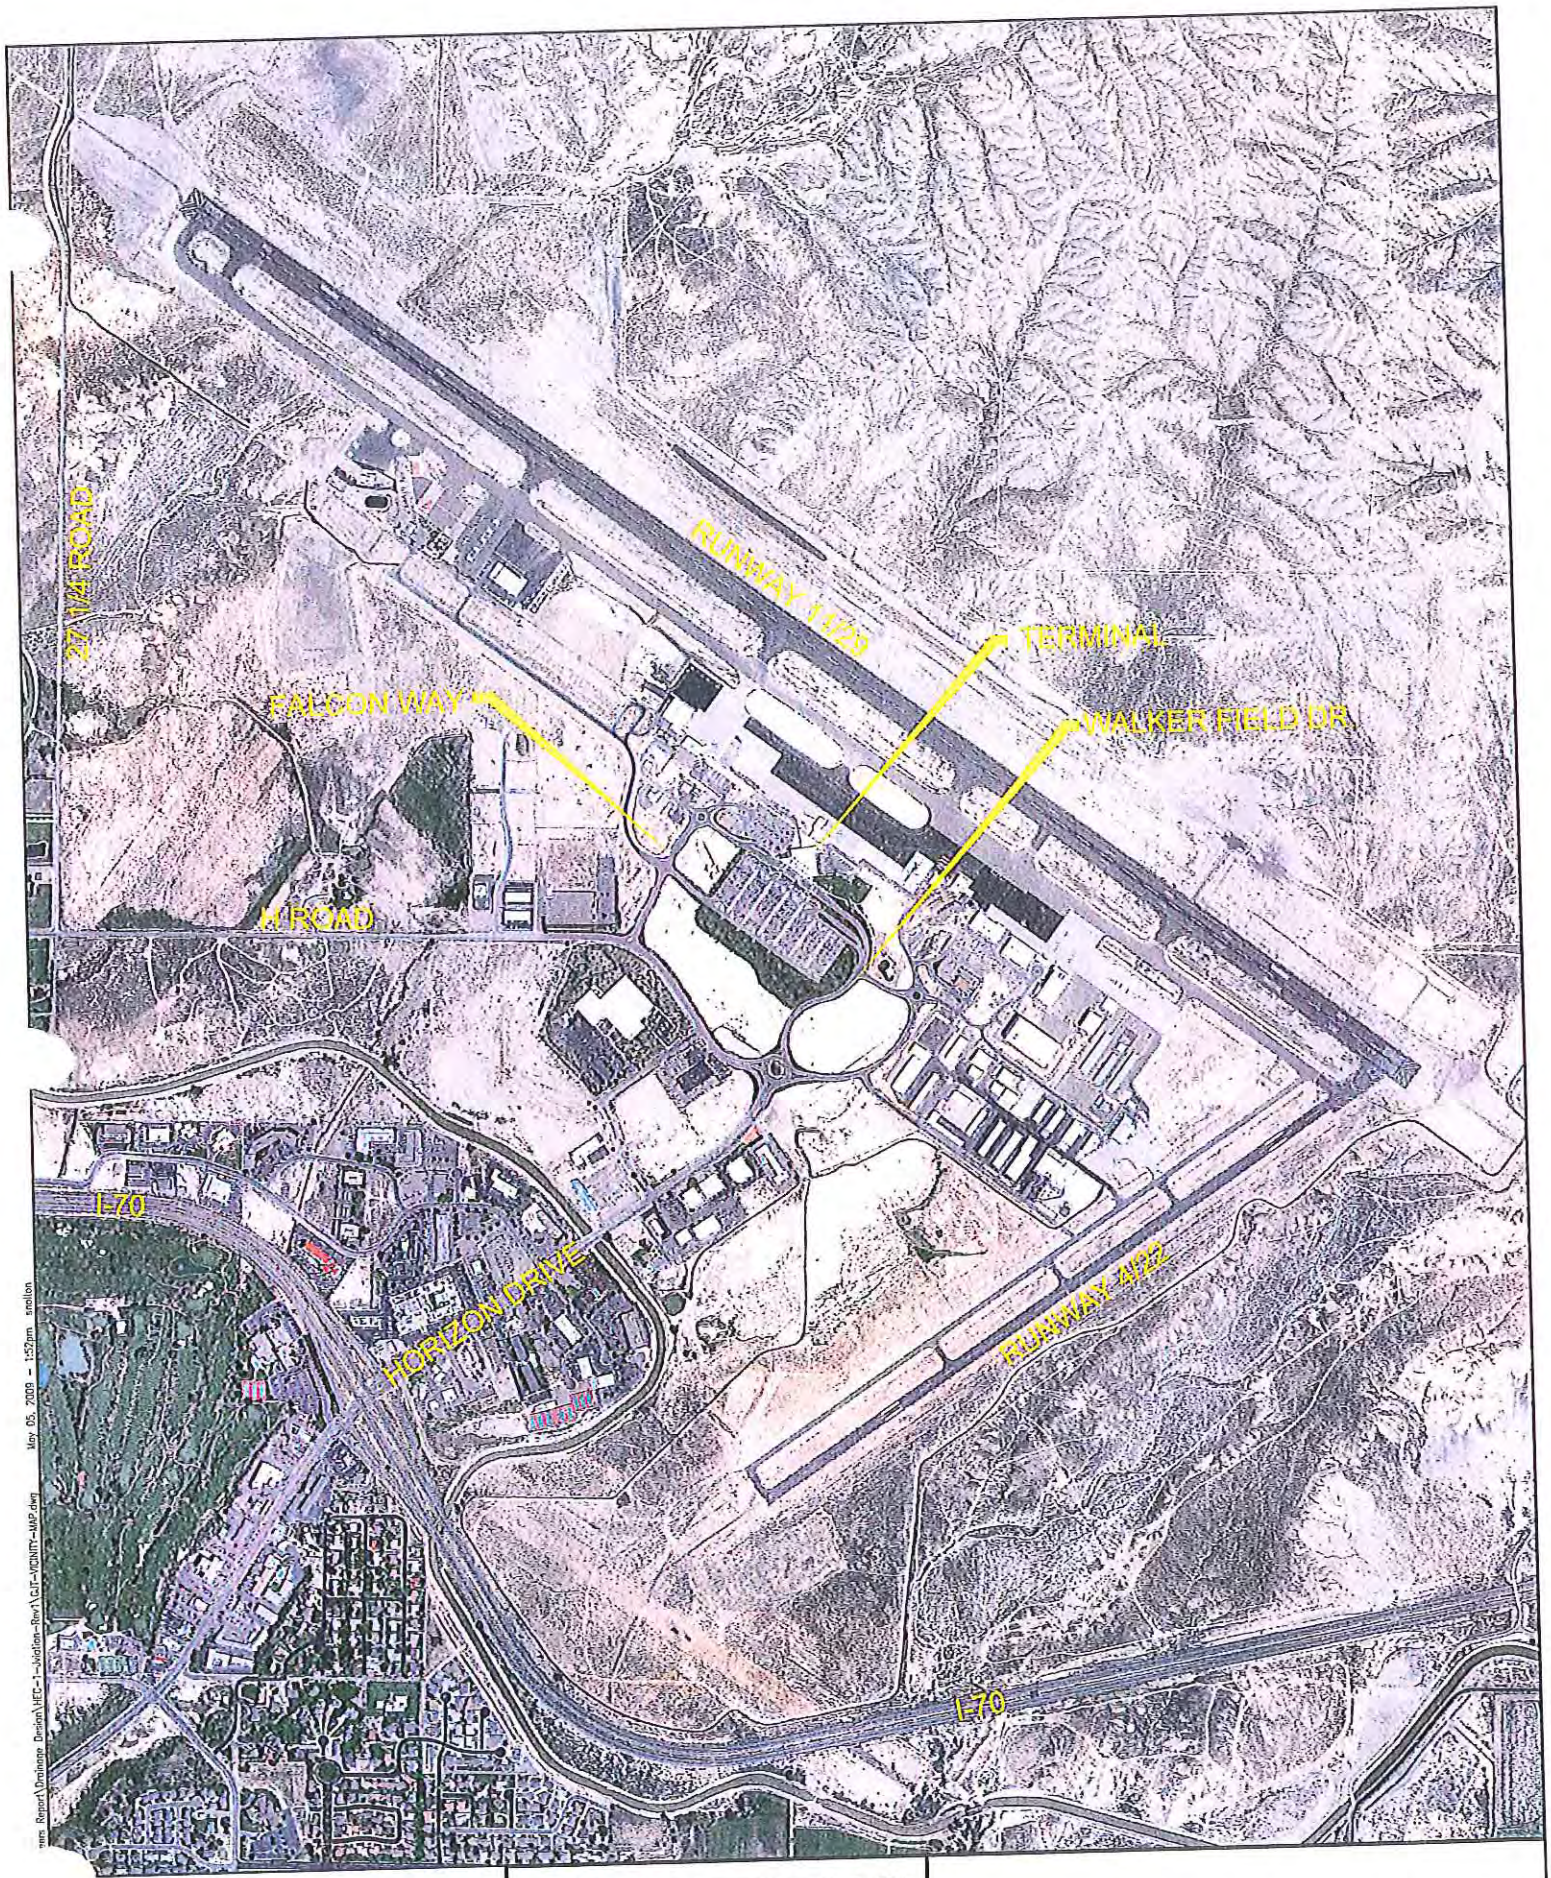
A. Compliance with Manual

This report is prepared in accordance with the procedures and concepts outlined in the City of Grand Junction Stormwater Management Manual (ref. 4) as well as the Urban Storm Drainage – Criteria Manual (ref. 1). Hydraulic Criteria as defined in the Stormwater Management Manual is adhered to and only the variance described above is requested.

B. Design Effectiveness

The design in the report allows the airport to develop portions of the property as required by future aviation demands. Detention ponds will be required in subbasins that are developed for roadway, apron or other aviation related improvements. These detention ponds will have to be designed for construction once the ultimate development is determined for each subbasin. This report gives the airport the guidelimes of location and potential size of new detention facilities. Final design of outlet structures and storm system conveyance from subbasin to subbasin will be completed in the future with each construction project.

C. Areas in Flood Hazard Zone



From the Flood Insurance Rate Map, Community Panel Number 080117 0001 0009, revised July 15, 1992, the entire airport lies in Zone X. Zone X is determined to be areas outside the 500-year flood plain.

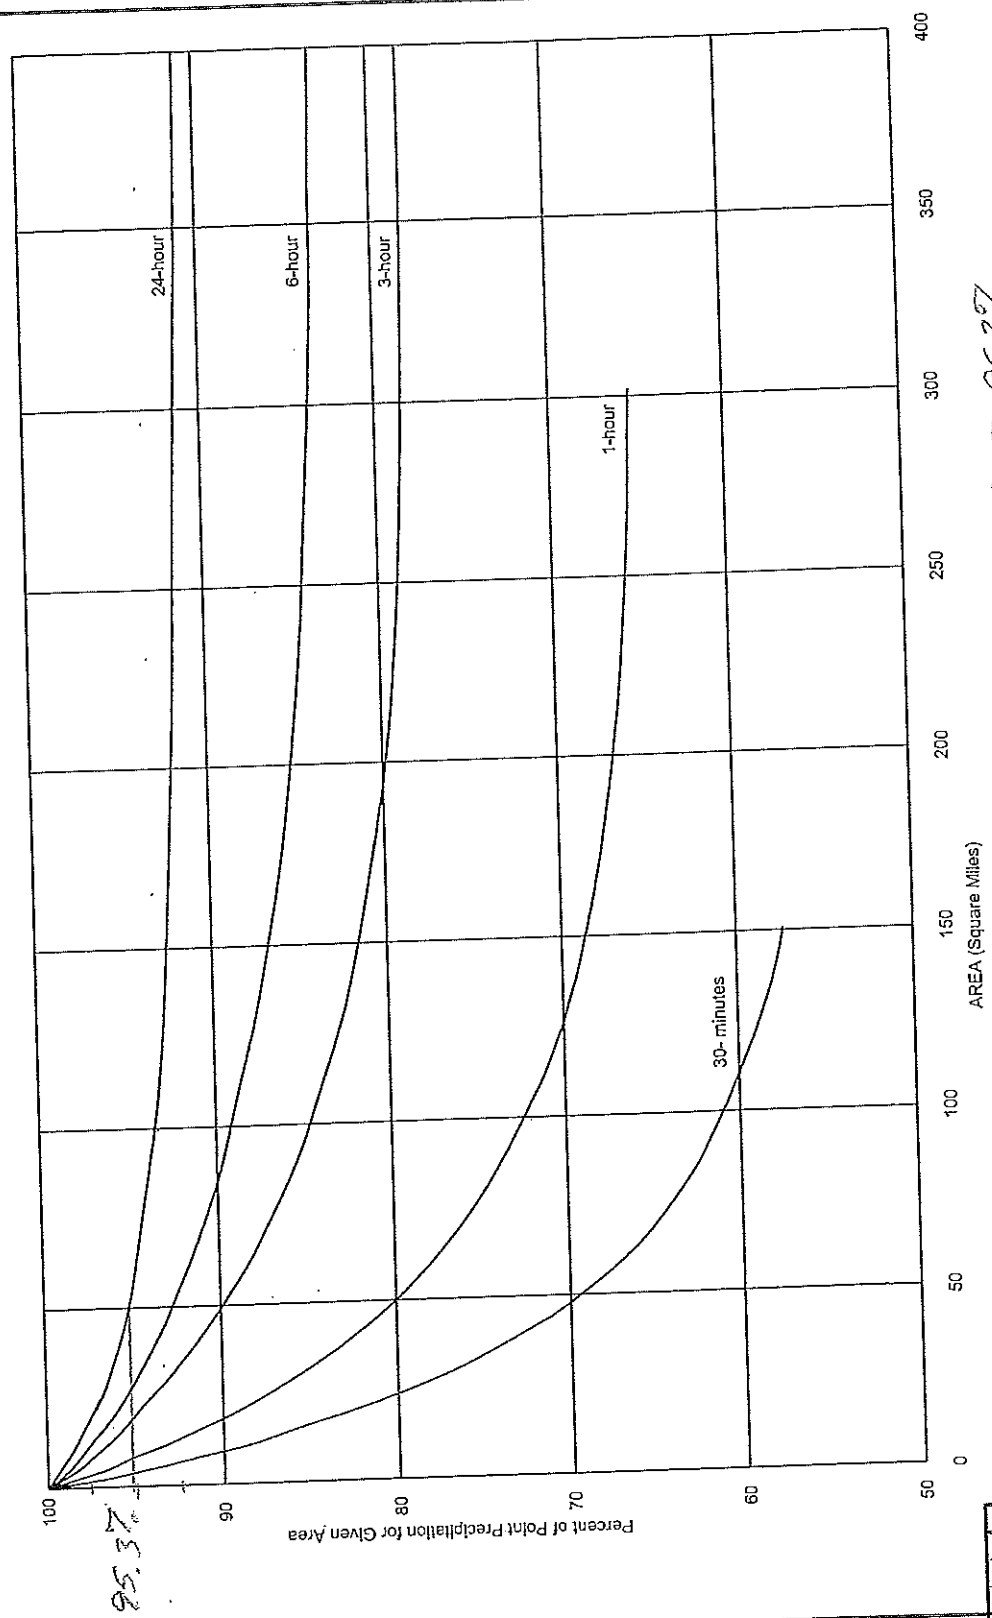
24-hr	0.70	0.93	1.12	1.42	1.69	2.01



For the area outside of the Grand Valley, the NOAA Atlas 2 Rainfall Depth-Duration-Frequency Maps are reproduced for the Mesa County area in **Figures 602 through 613**. Maps are presented for the 6- and 24-hour durations for the 2-, 5-, 10-, 25-, 50-, and 100-year recurrence intervals. Depending on the location of the project, point rainfall values are read from these figures, converted to other storm durations, and used to generate intensity-duration-frequency curves and design storms, following procedures described below.

For the areas within the Leach Creek/Horizon Drive watershed, point precipitation values are provided in **Table 602** for various frequencies and durations.

Table 602 - Point Rainfall Values for the Leach Creek/Horizon Drive Watershed

Storm Duration	Precipitation Depth (inches)

FIGURE 614

Table 705 Surface Retention Loss

Land Use and/or Surface Cover	Surface Retention Loss, IA (inches)
Natural	
Desert and rangeland, flat slope	0.35
Desert Hillslopes	0.15
Mountain with vegetated surface	0.25
Developed (Residential/commercial)	
Lawn and turf	0.20
Desert landscape	0.10
Pavement	0.05
Agricultural, tilled fields and irrigate pasture	0.50

The second phase of the rainfall loss process is infiltration of rainfall into the soil. The infiltration is assumed to begin after the surface retention loss is completely satisfied. Excess precipitation is computed using the Green-Ampt equations after the initial loss is satisfied. Required parameters are then the hydraulic conductivity of the soil at saturation, volumetric moisture deficit at the beginning of rainfall, and wetting front capillary action.

Typical values for Green-Ampt parameters were obtained from the *Drainage Design Manual for Maricopa County Hydrology* (Maricopa County 2003 (draft)), available at http://www.fcd.maricopa.gov/Resources/HydrologyManual.asp.

704.3.1 Soil Hydraulic Conductivity

The soil hydraulic conductivity is based on soil texture classification. Typical values for different soil type are listed in Table 706. For watershed areas of sub-watersheds consisting of several different soil textures, a composite value for Green-Ampt parameters should be used.

Table 706 Soil Hydraulic Conductivity Values

Soil Texture Classification	(for bare ground) Hydrologic Soils Group	Soil Hydraulic Conductivity (in/hr)
Loamy-sand and sand	A	1.20
Sandy-Loam	B	0.40
Loam	B	0.25
Silty-loam	C	0.15
Sandy clay-loam	C	0.06
Clay-loam	D	0.04
Silty clay-loam	D	0.04
Sandy-clay	D	0.02
Silty-clay	D	0.02
Clay	D	0.01

Hydraulic conductivity is affected by several factors besides soil texture, including soil crusting, tillage, ground cover, and canopy cover and should be adjusted. Ground cover, such as grass, litter, and gravel, will generally increase the infiltration rate over that of bare ground conditions.

RECOMMENDED IMPERVIOUSNESS VALUES

Land Use or Surface Characteristic	Percentage Imperviousness
Business	
Commercial Areas	85
Neighborhood Areas	70
Residential	
Single Family	(see figures)
Multi-unit (detached)	60
Multi-unit (attached)	75
Half-acre lot or larger	(see figures)
Apartments	80
Industrial	
Light industrial	80
Heavy industrial	90
Parks, cemeteries	5
Playgrounds	10
Schools	50
Railroad yards	15
Undeveloped Areas	
Historic flow analysis	2
Greenbelts, agriculture	2
Off-site flow analysis (when land use not defined)	45
Streets	
Paved (concrete/asphalt)	100
Gravel	40
Drives and walks	90
Roofs	90
Lawns (all soils)	0

NOTES:

1. The imperviousness values are representative of land uses shown and are for future development projections only. Impervious values for existing land uses may vary.
2. For areas that will not be developed, 2% imperviousness is an appropriate assumption where soil and vegetative cover are present. Areas with geological features, including significant rock outcroppings, need to be accounted for. See Section 702.2.

may not be correct. Incorrect results could cause serious consequences for flood control planning and design. Therefore, it is recommended that, for watersheds consisting of relatively small subareas of sand, the Green and Ampt parameter values for loamy sand be used for the sand portion of the watershed. If the area contains a large portion of sand, then either the Green and Ampt method should be used with the parameter values for loamy sand or the IL+ULR method should be used with the appropriately determined values for the parameters.

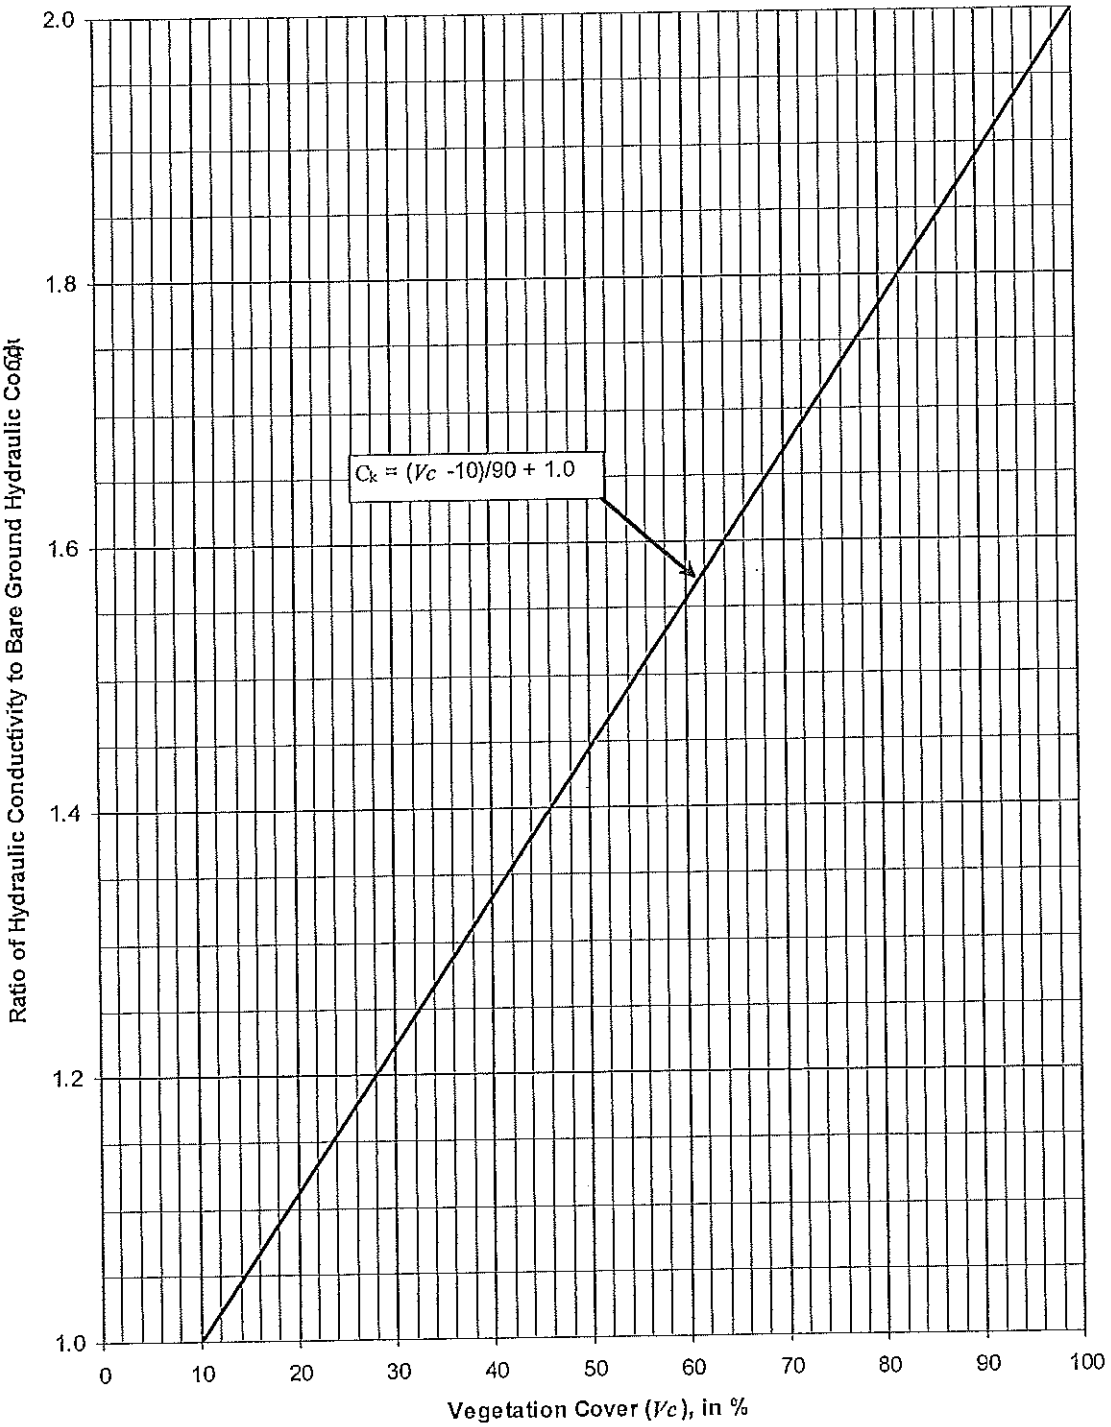

Table 4.1
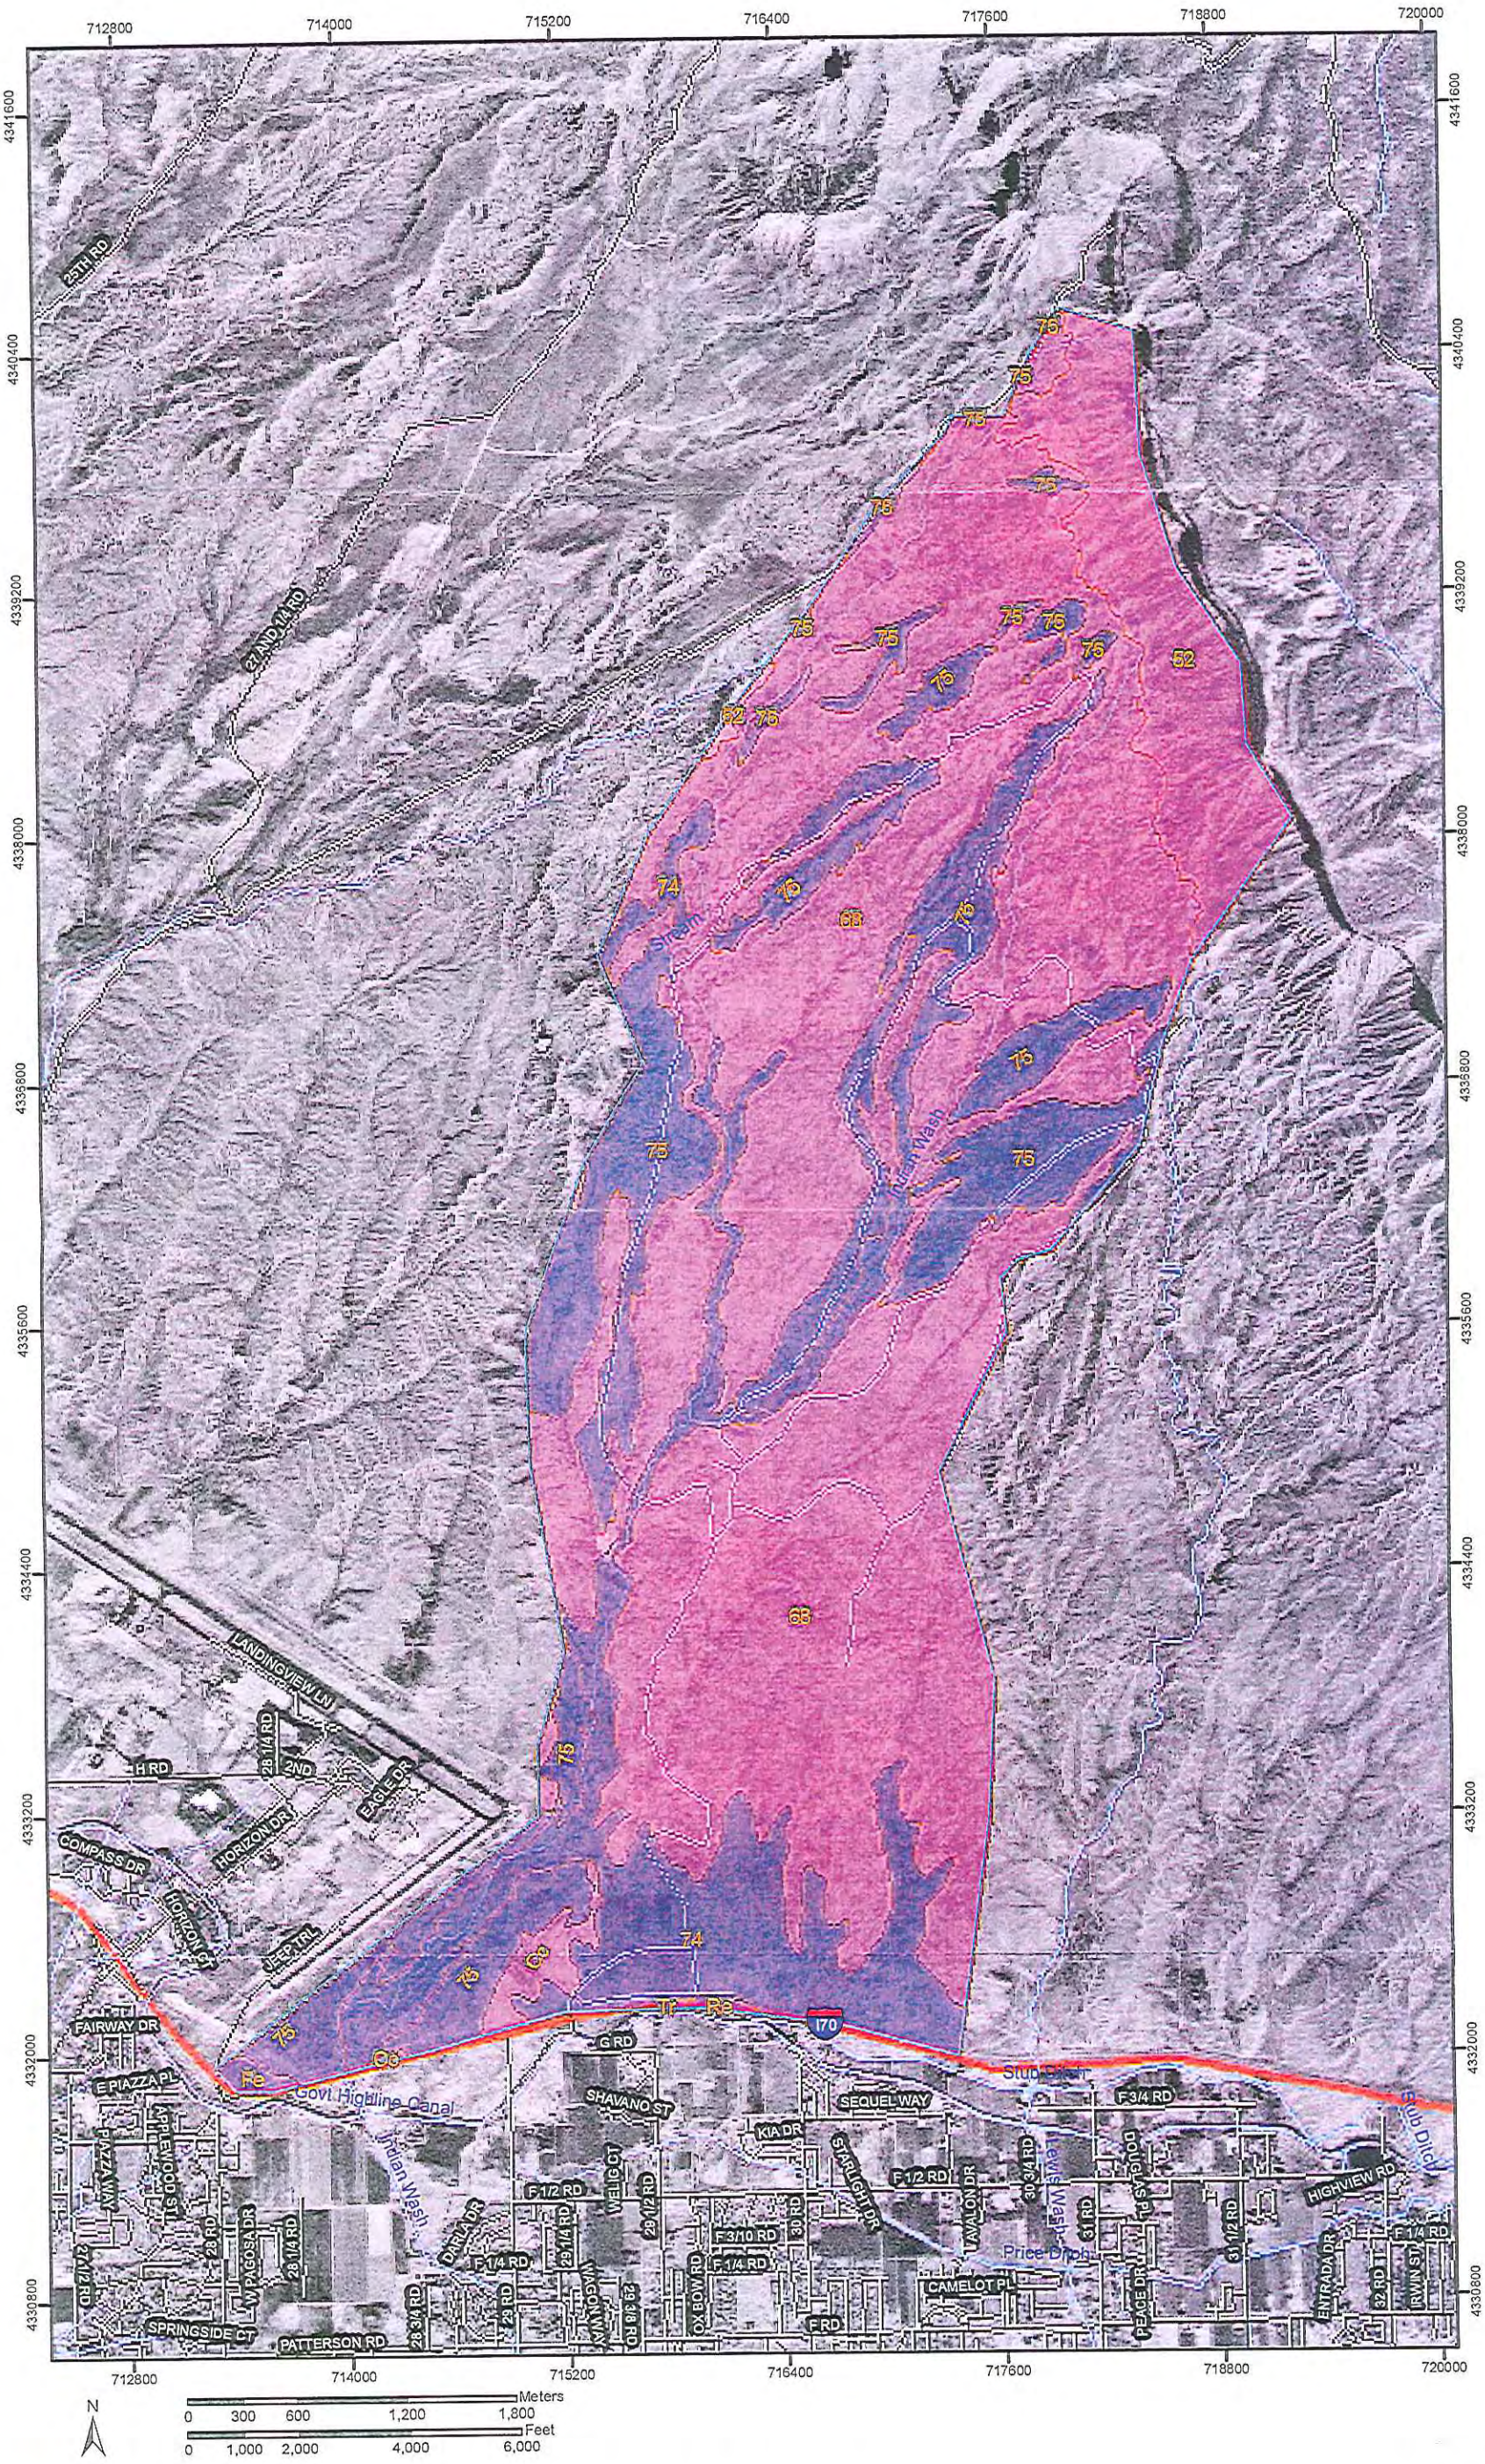
GREEN AND AMPT LOSS RATE PARAMETER VALUES FOR BARE GROUND

Soil Texture Classification (1)	XKSAT inches/hour (2)	PSIF inches (3)	DTHETA[1] Dry (4)	DTHETA[1] Normal (5)	DTHETA[1] Saturated (6)
loamy sand & sand	1.20	2.4	0.35	0.30	0
sandy loam	0.40	4.3	0.35	0.25	0
loam	0.25	3.5	0.35	0.25	0
silty loam	0.15	6.6	0.40	0.25	0
silt	0.10	7.5	0.35	0.15	0
sandy clay loam	0.06	8.6	0.25	0.15	0
clay loam	0.04	8.2	0.25	0.15	0
silty clay loam	0.04	10.8	0.30	0.15	0
sandy clay	0.02	9.4	0.20	0.10	0
silty clay	0.02	11.5	0.20	0.10	0
clay	0.01	12.4	0.15	0.05	0



Notes:
1. Selection of DTHETA

Dry	=	Nonirrigated lands, such as desert and rangeland;
Normal	=	Irrigated lawn, turf, and permanent pasture;
Saturated	=	Irrigated agricultural land.

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

MAP INFORMATION

Original soil survey map sheets were prepared at publication scale. Viewing scale and printing scale, however, may vary from the original. Please rely on the bar scale on each map sheet for proper map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL: http://websoilsurvey.nrcs.usda.gov
Coordinate System: UTM Zone 12N

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Mesa County Area, Colorado
Survey Area Data: Version 3, Sep 25, 2007

Date(s) aerial images were photographed: 8/3/1993

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Hydrologic Soil Group— Summary by Map Unit — Mesa County Area, Colorado				
Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
68	Killpack-Badlands-Persayo complex, 3 to 25 percent slopes, saline	D	76.6	20.7%
Av	Avalon sandy loam, gravelly substratum, 2 to 5 percent slopes	B	16.3	4.4%
AvC	Avalon loam, gravelly substratum, 5 to 25 percent slopes	B	16.8	4.5%
Bd	Sagers silty clay loam, 2 to 5 percent slopes	B	50.3	13.6%
Cc	Persayo silty clay loam, 5 to 12 percent slopes	D	87.5	23.6%
Ce	Persayo silty clay loam, 2 to 5 percent slopes	D	12.2	3.3%
Fe	Fruita clay loam, 0 to 2 percent slopes	B	0.0	0.0%
Hj	Killpack silty clay, 2 to 5 percent slopes	C	110.6	29.9%
Totals for Area of Interest (AOI)			370.3	100.0%

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Rating Options

Aggregation Method: Dominant Condition

Component Percent Cutoff: *None Specified*

Tie-break Rule: Lower

f. **Underwater waste discharges.** The FAA recommends against the underwater discharge of any food waste (e.g., fish processing offal) within the separations identified in Sections 1-2 through 1-4 because it could attract scavenging hazardous wildlife.

g. **Recycling centers.** Recycling centers that accept previously sorted non-food items, such as glass, newspaper, cardboard, or aluminum, are, in most cases, not attractive to hazardous wildlife and are acceptable.

h. **Construction and demolition (C&D) debris facilities.** C&D landfills do not generally attract hazardous wildlife and are acceptable if maintained in an orderly manner, admit no putrescible waste, and are not co-located with other waste disposal operations. However, C&D landfills have similar visual and operational characteristics to putrescible waste disposal sites. When co-located with putrescible waste disposal operations, C&D landfills are more likely to attract hazardous wildlife because of the similarities between these disposal facilities. Therefore, a C&D landfill co-located with another waste disposal operation should be located outside of the separations identified in Sections 1-2 through 1-4.

i. **Fly ash disposal.** The incinerated residue from resource recovery power/heat-generating facilities that are fired by municipal solid waste, coal, or wood is generally not a wildlife attractant because it no longer contains putrescible matter. Landfills accepting only fly ash are generally not considered to be wildlife attractants and are acceptable as long as they are maintained in an orderly manner, admit no putrescible waste of any kind, and are not co-located with other disposal operations that attract hazardous wildlife.

   Since varying degrees of waste consumption are associated with general incineration (not resource recovery power/heat-generating facilities), the FAA considers the ash from general incinerators a regular waste disposal by-product and, therefore, a hazardous wildlife attractant if disposed of within the separation criteria outlined in Sections 1-2 through 1-4.

2-3. WATER MANAGEMENT FACILITIES. Drinking water intake and treatment facilities, storm water and wastewater treatment facilities, associated retention and settling ponds, ponds built for recreational use, and ponds that result from mining activities often attract large numbers of potentially hazardous wildlife. To prevent wildlife hazards, land-use developers and airport operators may need to develop management plans, in compliance with local and state regulations, to support the operation of storm water management facilities on or near all public-use airports to ensure a safe airport environment.

a. **Existing storm water management facilities.** On-airport storm water management facilities allow the quick removal of surface water, including discharges related to aircraft deicing, from impervious surfaces, such as pavement and terminal/hangar building roofs. Existing on-airport detention ponds collect storm water, protect water quality, and control runoff. Because they slowly release water

after storms, they create standing bodies of water that can attract hazardous wildlife. Where the airport has developed a Wildlife Hazard Management Plan (WHMP) in accordance with Part 139, the FAA requires immediate correction of any wildlife hazards arising from existing storm water facilities located on or near airports, using appropriate wildlife hazard mitigation techniques. Airport operators should develop measures to minimize hazardous wildlife attraction in consultation with a wildlife damage management biologist.

Where possible, airport operators should modify storm water detention ponds to allow a maximum 48-hour detention period for the design storm. The FAA recommends that airport operators avoid or remove retention ponds and detention ponds featuring dead storage to eliminate standing water. Detention basins should remain totally dry between rainfalls. Where constant flow of water is anticipated through the basin, or where any portion of the basin bottom may remain wet, the detention facility should include a concrete or paved pad and/or ditch/swale in the bottom to prevent vegetation that may provide nesting habitat.

When it is not possible to drain a large detention pond completely, airport operators may use physical barriers, such as bird balls, wires grids, pillows, or netting, to deter birds and other hazardous wildlife. When physical barriers are used, airport operators must evaluate their use and ensure they will not adversely affect water rescue. Before installing any physical barriers over detention ponds on Part 139 airports, airport operators must get approval from the appropriate FAA Regional Airports Division Office.

The FAA recommends that airport operators encourage off-airport storm water treatment facility operators to incorporate appropriate wildlife hazard mitigation techniques into storm water treatment facility operating practices when their facility is located within the separation criteria specified in Sections 1-2 through 1-4.

b. **New storm water management facilities.** The FAA strongly recommends that off-airport storm water management systems located within the separations identified in Sections 1-2 through 1-4 be designed and operated so as not to create above-ground standing water. Stormwater detention ponds should be designed, engineered, constructed, and maintained for a maximum 48–hour detention period after the design storm and remain completely dry between storms. To facilitate the control of hazardous wildlife, the FAA recommends the use of steep-sided, rip-rap lined, narrow, linearly shaped water detention basins. When it is not possible to place these ponds away from an airport's AOA, airport operators should use physical barriers, such as bird balls, wires grids, pillows, or netting, to prevent access of hazardous wildlife to open water and minimize aircraft-wildlife interactions. When physical barriers are used, airport operators must evaluate their use and ensure they will not adversely affect water rescue. Before installing any physical barriers over detention ponds on Part 139 airports, airport operators must get approval from the appropriate FAA Regional Airports Division Office. All vegetation in or around detention basins that provide food or cover for hazardous wildlife should be eliminated. If soil conditions and other requirements allow, the FAA encourages

the use of underground storm water infiltration systems, such as French drains or buried rock fields, because they are less attractive to wildlife.

c. **Existing wastewater treatment facilities.** The FAA strongly recommends that airport operators immediately correct any wildlife hazards arising from existing wastewater treatment facilities located on or near the airport. Where required, a WHMP developed in accordance with Part 139 will outline appropriate wildlife hazard mitigation techniques. Accordingly, airport operators should encourage wastewater treatment facility operators to incorporate measures, developed in consultation with a wildlife damage management biologist, to minimize hazardous wildlife attractants. Airport operators should also encourage those wastewater treatment facility operators to incorporate these mitigation techniques into their standard operating practices. In addition, airport operators should consider the existence of wastewater treatment facilities when evaluating proposed sites for new airport development projects and avoid such sites when practicable.

d. **New wastewater treatment facilities.** The FAA strongly recommends against the construction of new wastewater treatment facilities or associated settling ponds within the separations identified in Sections 1-2 through 1-4. Appendix 1 defines wastewater treatment facility as "any devices and/or systems used to store, treat, recycle, or reclaim municipal sewage or liquid industrial wastes." The definition includes any pretreatment involving the reduction of the amount of pollutants or the elimination of pollutants prior to introducing such pollutants into a publicly owned treatment works (wastewater treatment facility). During the site-location analysis for wastewater treatment facilities, developers should consider the potential to attract hazardous wildlife if an airport is in the vicinity of the proposed site, and airport operators should voice their opposition to such facilities if they are in proximity to the airport.

e. **Artificial marshes.** In warmer climates, wastewater treatment facilities sometimes employ artificial marshes and use submergent and emergent aquatic vegetation as natural filters. These artificial marshes may be used by some species of flocking birds, such as blackbirds and waterfowl, for breeding or roosting activities. The FAA strongly recommends against establishing artificial marshes within the separations identified in Sections 1-2 through 1-4.

f. **Wastewater discharge and sludge disposal.** The FAA recommends against the discharge of wastewater or sludge on airport property because it may improve soil moisture and quality on unpaved areas and lead to improved turf growth that can be an attractive food source for many species of animals. Also, the turf requires more frequent mowing, which in turn may mutilate or flush insects or small animals and produce straw, both of which can attract hazardous wildlife. In addition, the improved turf may attract grazing wildlife, such as deer and geese. Problems may also occur when discharges saturate unpaved airport areas. The resultant soft, muddy conditions can severely restrict or prevent emergency vehicles from reaching accident sites in a timely manner.

Chapter 2: Estimating runoff

SCS Runoff Curve Number method

The SCS Runoff Curve Number (CN) method is described in detail in NEH-4 (SCS 1985). The SCS runoff equation is

$$Q = \frac{(P - I_a)^2}{(P - I_a) + S} \qquad \text{[Eq. 2-1]}$$

where

Q = runoff (in),
P = rainfall (in),
S = potential maximum retention after runoff begins (in), and
I_a = initial abstraction (in).

Initial abstraction (I_a) is all losses before runoff begins. It includes water retained in surface depressions, water intercepted by vegetation, evaporation, and infiltration. I_a is highly variable but generally is correlated with soil and cover parameters. Through studies of many small agricultural watersheds, I_a was found to be approximated by the following empirical equation:

$$I_a = 0.2S. \qquad \text{[Eq. 2-2]}$$

By removing I_a as an independent parameter, this approximation allows use of a combination of S and P to produce a unique runoff amount. Substituting equation 2-2 into equation 2-1 gives

$$Q = \frac{(P - 0.2S)^2}{(P + 0.8S)} \qquad \text{[Eq. 2-3]}$$

S is related to the soil and cover conditions of the watershed through the CN. CN has a range of 0 to 100, and S is related to CN by

$$S = \frac{1000}{CN} - 10. \qquad \text{[Eq. 2-4]}$$

Figure 2-1 and table 2-1 solve equations 2-3 and 2-4 for a range of CN's and rainfall.

Factors considered in determining runoff curve numbers

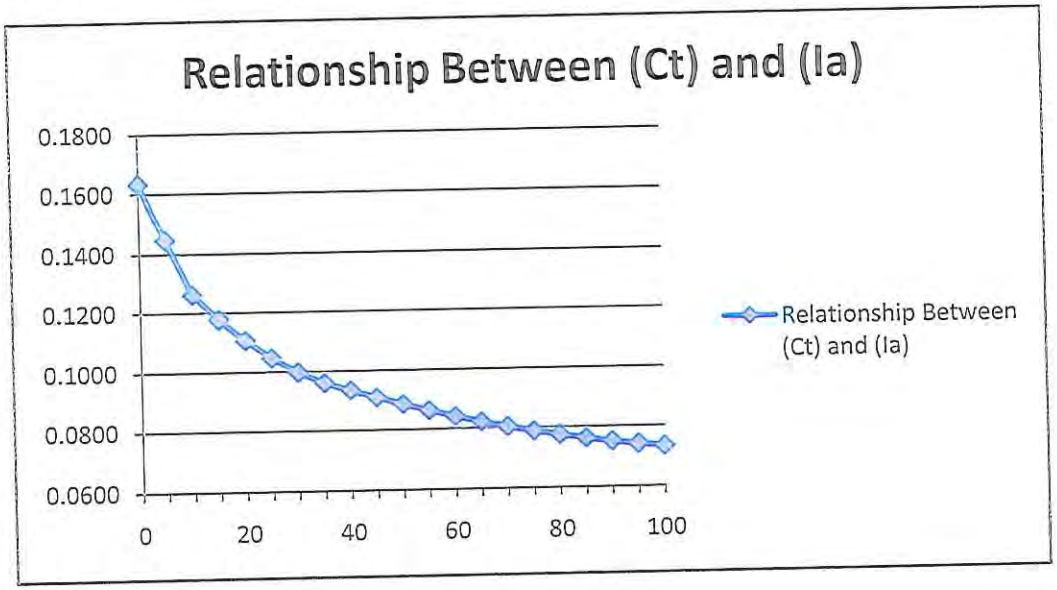
The major factors that determine CN are the hydrologic soil group (HSG), cover type, treatment, hydrologic condition, and antecedent runoff condition (ARC). Another factor considered is whether impervious areas outlet directly to the drainage system (connected) or whether the flow spreads over pervious areas before entering the drainage system (unconnected). Figure 2-2 is provided to aid in selecting the appropriate figure or table for determining curve numbers.

CN's in table 2-2 (*a* to *d*) represent average antecedent runoff condition for urban, cultivated agricultural, other agricultural, and arid and semiarid rangeland uses. Table 2-2 assumes impervious areas are directly connected. The following sections explain how to determine CN's and how to modify them for urban conditions.

Hydrologic soil groups

Infiltration rates of soils vary widely and are affected by subsurface permeability as well as surface intake rates. Soils are classified into four HSG's (A, B, C, and D) according to their minimum infiltration rate, which is obtained for bare soil after prolonged wetting. Appendix A defines the four groups and provides a list of most of the soils in the United States and their group classification. The soils in the area of interest may be identified from a soil survey report, which can be obtained from local SCS offices or soil and water conservation district offices.

Most urban areas are only partially covered by impervious surfaces: the soil remains an important factor in runoff estimates. Urbanization has a greater effect on runoff in watersheds with soils having high infiltration rates (sands and gravels) than in watersheds predominantly of silts and clays, which generally have low infiltration rates.



Any disturbance of a soil profile can significantly change its infiltration characteristics. With urbanization, native soil profiles may be mixed or removed or fill material from other areas may be introduced. Therefore, a method based on soil

Table 2-2c Runoff curve numbers for other agricultural lands [1]

Cover description		Curve numbers for hydrologic soil group			
Cover type	Hydrologic condition	A	B	C	D
Pasture, grassland, or range—continuous forage for grazing. [2]	Poor	68	79	86	89
	Fair	49	69	79	84
	Good	39	61	74	80
Meadow—continuous grass, protected from grazing and generally mowed for hay.	—	30	58	71	78
Brush—brush-weed-grass mixture with brush the major element. [3]	Poor	48	67	77	83
	Fair	35	56	70	77
	Good	30 [4]	48	65	73
Woods—grass combination (orchard or tree farm). [5]	Poor	57	73	82	86
	Fair	43	65	76	82
	Good	32	58	72	79
Woods. [6]	Poor	45	66	77	83
	Fair	36	60	73	79
	Good	30 [4]	55	70	77
Farmsteads—buildings, lanes, driveways, and surrounding lots.	—	59	74	82	86

1 Average runoff condition, and $I_a = 0.2S$.
2 *Poor:* <50%) ground cover or heavily grazed with no mulch.
Fair: 50 to 75% ground cover and not heavily grazed.
Good: > 75% ground cover and lightly or only occasionally grazed.
3 *Poor:* <50% ground cover.
Fair: 50 to 75% ground cover.
Good: >75% ground cover.
4 Actual curve number is less than 30; use CN = 30 for runoff computations.
5 CN's shown were computed for areas with 50% woods and 50% grass (pasture) cover. Other combinations of conditions may be computed from the CN's for woods and pasture.
6 *Poor:* Forest litter, small trees, and brush are destroyed by heavy grazing or regular burning.
Fair: Woods are grazed but not burned, and some forest litter covers the soil.
Good: Woods are protected from grazing, and litter and brush adequately cover the soil.

Table 2-2a Runoff curve numbers for urban areas [1]

Cover description: Cover type and hydrologic condition	Average percent impervious area [2]	Curve numbers for hydrologic soil group: A	B	C	D
Fully developed urban areas (vegetation established)					
Open space (lawns, parks, golf courses, cemeteries, etc.) [3]:					
Poor condition (grass cover < 50%)		68	79	86	89
Fair condition (grass cover 50% to 75%)		49	69	79	84
Good condition (grass cover > 75%)		39	61	74	80
Impervious areas:					
Paved parking lots, roofs, driveways, etc. (excluding right-of-way)		98	98	98	98
Streets and roads:					
Paved; curbs and storm sewers (excluding right-of-way)		98	98	98	98
Paved; open ditches (including right-of-way)		83	89	92	93
Gravel (including right-of-way)		76	85	89	91
Dirt (including right-of-way)		72	82	87	89
Western desert urban areas:					
Natural desert landscaping (pervious areas only) [4]		63	77	85	88
Artificial desert landscaping (impervious weed barrier, desert shrub with 1- to 2-inch sand or gravel mulch and basin borders)		96	96	96	96
Urban districts:					
Commercial and business	85	89	92	94	95
Industrial	72	81	88	91	93
Residential districts by average lot size:					
1/8 acre or less (town houses)	65	77	85	90	92
1/4 acre	38	61	75	83	87
1/3 acre	30	57	72	81	86
1/2 acre	25	54	70	80	85
1 acre	20	51	68	79	84
2 acres	12	46	65	77	82
Developing urban areas					
Newly graded areas (pervious areas only, no vegetation) [5]		77	86	91	94
Idle lands (CN's are determined using cover types similar to those in table 2-2c).					

1 Average runoff condition, and $I_a = 0.2S$.

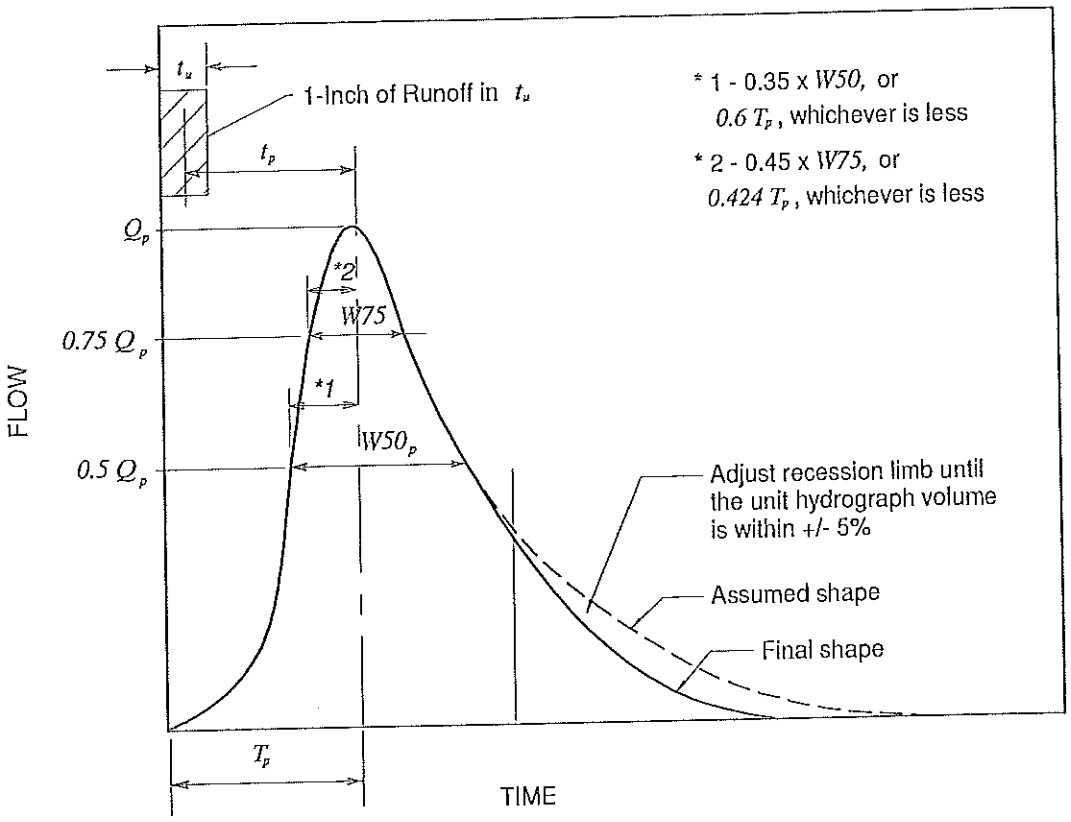
2 The average percent impervious area shown was used to develop the composite CN's. Other assumptions are as follows: impervious areas are directly connected to the drainage system, impervious areas have a CN of 98, and pervious areas are considered equivalent to open space in good hydrologic condition. CN's for other combinations of conditions may be computed using figure 2-3 or 2-4.

3 CN's shown are equivalent to those of pasture. Composite CN's may be computed for other combinations of open space cover type.

4 Composite CN's for natural desert landscaping should be computed using figures 2-3 or 2-4 based on the impervious area percentage (CN = 98) and the pervious area CN. The pervious area CN's are assumed equivalent to desert shrub in poor hydrologic condition.

5 Composite CN's to use for the design of temporary measures during grading and construction should be computed using figure 2-3 or 2-4 based on the degree of development (impervious area percentage) and the CN's for the newly graded pervious areas.

2. Infiltration and depression losses can no longer be varied from storm to storm. To do so, the user has to set up a new CUHP run for each storm or a group of storms that have different infiltration and depression losses.
3. Depression storage loss values are entered separately for the pervious and impervious areas.
4. If a detailed storm hyetograph input option is used, the user needs to identify the storm and then input incremental rainfall depths for each time increment of the hyetograph.
   If the 1-hour design rainfall depth input option is to be used, the user needs to identify the design storm (i.e., 2-, 5-, 10-, 50-, or 100-year) and then enter the 1-hour depth. The Excel program will then generate the design hyetograph using the USDCM protocols. Should the user want to generate hydrographs for the 500-year storm with the 1-hour depth input option, enter the 500-year 1-hour depth and then 100-year for the design storm. The software will use the 100-year distribution to develop a 2-hour design storm.
5. For all practical purposes, there are no limits to the number of different hyetographs that can be entered. The user may input several sets of storms developed for different parts of the study area and then to specify the specific the storm to be used by a given catchment for each run of CUHP.



Unit and Storm Hydrograph

The CUHP2005 program will generate a unit hydrograph column matrix for each catchment. It will then set up an excess precipitation row matrix for each storm called by the catchment data, which it then cross-multiplies with the unit hydrograph matrix. The resultant storm hydrographs are then printed or routed to output files. Unit hydrographs are developed using several catchment parameters and the equations found in the USDCM. As an option, the coefficients *Cp* and *Ct*, if known or predetermined, can be input directly to override the values computed by the Excel macro using the USDCM protocols. The level of DCIA can be also be input as catchment data. If DCIA levels are not entered, the program defaults to "established practice" mode. The Excel spreadsheet also allows the user to enter calibrating multipliers to adjust the coefficients that are shown on the spreadsheet as "Used by CUHP2005". This feature was provided to permit the user to calibrate the CUHP2005 output to known rainfall/runoff data.

CUHP2005 is based on four basic equations used in defining the shape of the synthetic unit hydrograph. Figure 1 defines the terms used to describe the unit hydrograph and some of the default shaping factors. With this as a reference, the first equation defines the time to peak (t_p) the time from the center of the unit storm duration to the peak of the unit hydrograph:

$$t_p = C_t \cdot \left(\frac{L \cdot L_{ca}}{\sqrt{S}} \right)^{0.48}$$

in which, t_p = time to peak of the unit hydrograph from midpoint of unit rainfall in hours

L = length along the drainageway path from study point to the most upstream limits of the catchment in miles

L_{ca} = length along stream from study point to a point along stream adjacent to the centroid of the catchment in miles

Figure 1. Elements of a Unit Hydrograph.

S = length weighted average slope of catchment along the drainageway path to upstream limits of the catchment in feet per foot

C_t = coefficient reflecting time to peak

A 5-minute unit hydrograph produces reasonable length outpnt files and longer using times are not recommended for urban hydrology. The user has the option of using any unit time increment regardless of the rainfall unit time increments used to define the hyetograph being used.

The second equation is,

$$T_p = 60 \cdot t_p + 0.5 \cdot t_u$$

in which, T_p = time from the beginning of unit rainfall to the peak of the unit hydrograph
t_u = duration of unit rainfall

The third equation is,

$$q_p = \frac{640 \cdot C_p}{t_p}$$

in which, q_p = peak rate of runoff in cfs per square mile
C_p = coefficient related to peak rate of runoff

The fourth equation is,

$$Q_p = q_p \cdot A$$

in which, Q_p = peak of the unit hydrograph in cfs
A = area of catchment in square miles

The maximum recommended catchment size for any single unit hydrograph is 5-square miles. Whenever a larger catchment is studied, it should be subdivided into sub-catchments of 5-square miles or less. These are then combined and routed downstream using appropriate channel routing procedures.

The minimum catchment size recommended for use with the CUHP2005 program is 5 to 10 acres. If the Rational Formula option is used, the minimum catchment size is five (5) acres for catchments with 25% or more imperviousness and 2 acres for catchments with less than 25% imperviousness.

Subdivide very long catchments (i.e., ones with length to width ratio of four or more) into more regularly shaped sub-catchments. Although not an absolute rule, the length to width ratio of four should not be exceeded.

Natural and grass-lined drainageways and channels become unstable when the Froude Number approaches 1.0 and natural processes work to limit the reduction in time to peak as these drainageways become steeper. To account for this, the slope used in the second equation, one to find

t_p, for natural and grass-lined channels needs to be adjusted using Figure 2. These adjustments have been determined to give more realistic hydrologic results in steep terrain.

Grass-lined channels designed and built using UDFCD criteria have a slope that limits maximum control velocities. A typical range in slopes for these channels is 0.004 ft/ft to 0.007 ft/ft and it is recommended that initial hydrologic runs use a slope of 0.005 ft/ft when grass-lined channels are to be designed using UDFCD criteria.

For riprap and concrete-lined channels and storm sewers use the actual flow line slope, especially where they dominate the catchment drainageways.

When the flow line slope varies along the drainageway path, calculate a length-weighted catchment slope. Do this by:

1. Segmenting the drainageway into reaches of similar longitudinal slopes
2. Correct the slope of a steep reach using the correction coefficient taken form Figure 2.
3. Apply the following equation using the corrected slope for each reach:

$$S = \left(\frac{L_1 \cdot S_1^{0.24} + L_2 \cdot S_2^{0.24} + \cdots + L_n \cdot S_n^{0.24}}{L_1 + L_2 + \cdots + L_n} \right)^{4.17}$$

in which, S = weighted catchment waterway slope in ft/ft
$S_1, S_2, \ldots S_n$ = slopes of individual reaches in ft/ft (after adjustments using Figure 2)
$L_1, L_2, \ldots L_n$ = lengths of corresponding reaches

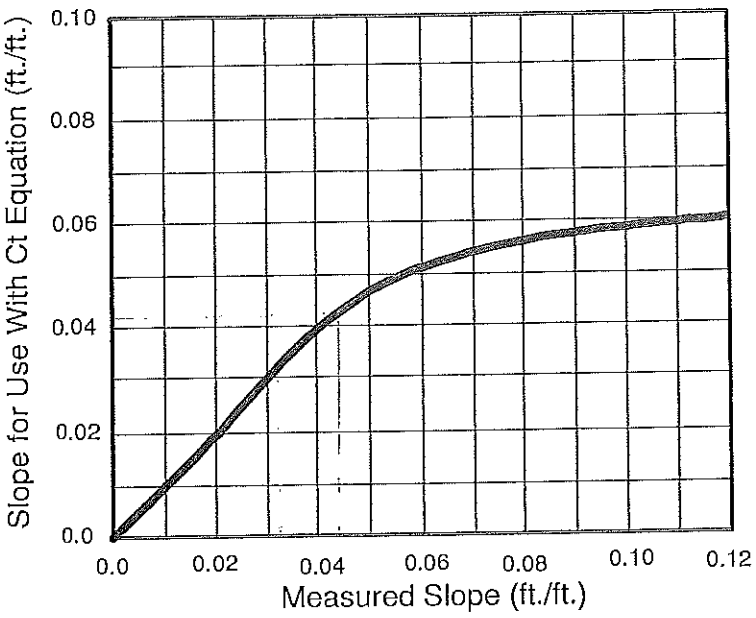


Figure 2: Slope Correction for Natural and Grass-Lined Channels

The value of C_t is calculated by CUHP2005 using the "Equations of Curve" in Figure 3.

The program uses the "Equations of Curve" shown on Figure 4 to determine the value of C_p. Using the Peaking Parameter P taken for Figure 4, C_p is calculated using the following equations:

If A>0.141

$$C_p = P \cdot C_t \cdot A^{0.15}$$

Otherwise

$$Cp = P\ Ct\ A^{\left(0.25 - \frac{A}{0.141}\right)}$$

in which,

C_p	=	unit hydrograph peaking coefficient
C_t	=	Time to peak coefficient
P	=	peaking parameter
A	=	catchment area in square miles

The Figure 5 is used to help shape the unit hydrograph. The relationships shown are part of the CUHP2005 program and provide the width of the unit hydrograph at 50% and 75% of its peak discharge value. Using these values for widths and built-in values for how these widths are distributed in front of the time-to-peak of the unit hydrograph, a set of 6 coordinates are fixed that are used to shape the unit hydrograph. Curvilinear relationships are passed through these points and the

residual unit area is then adjusted using an exponential decay function so that the area under the unit hydrograph equals one-inch of runoff form the catchment.

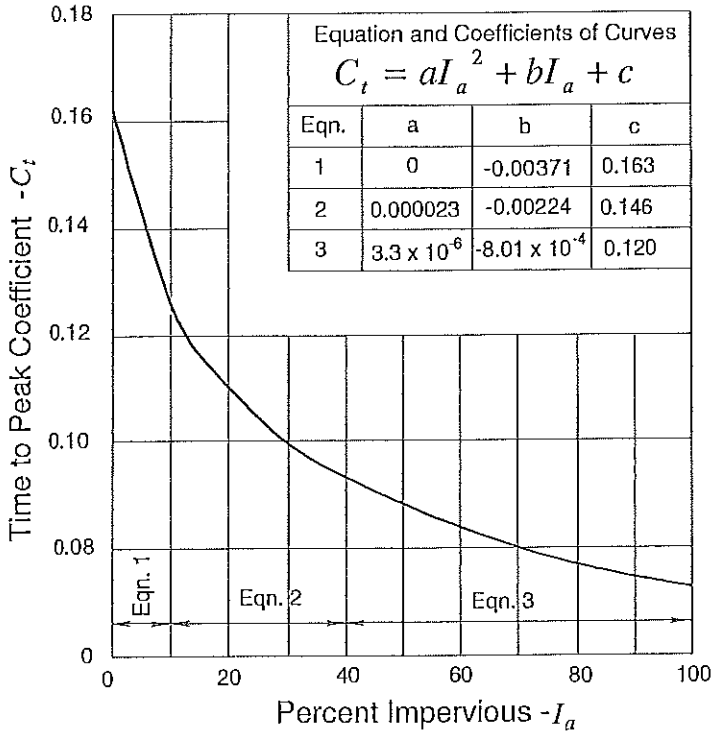

Figure 3: Relationship Between C_t and Imperviousness (I_a)

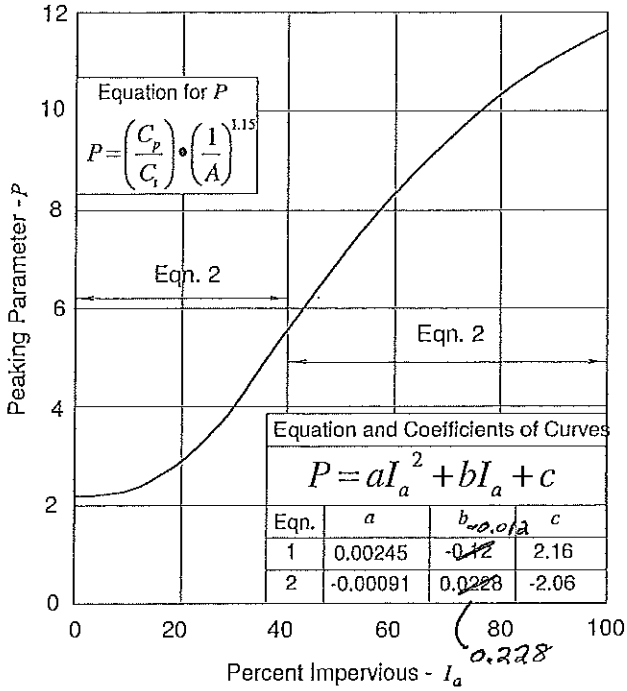

Figure 4: Relationship Between Peaking Parameter *(P)* and Imperviousness *(I_a)*

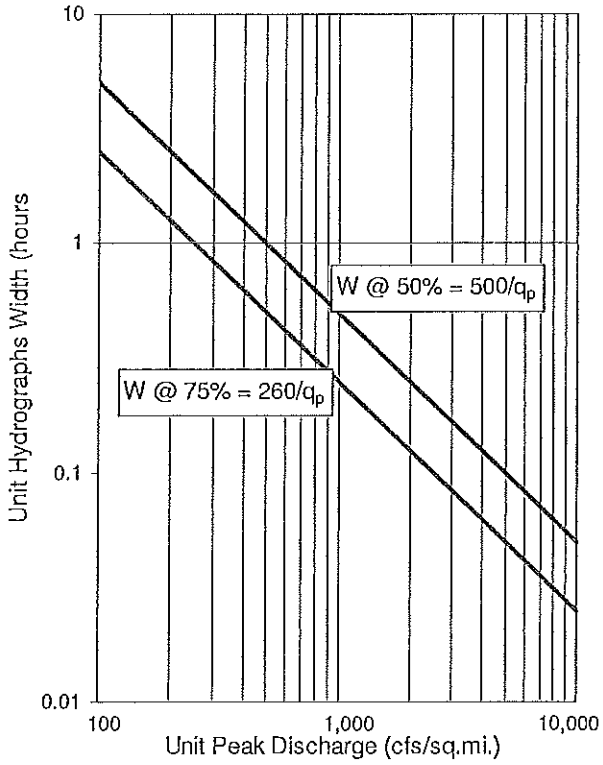

Figure 5: Unit Hydrograph Widths

```

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

*** WARNING *** MODIFIED PULS ROUTING MAY BE NUMERICALLY UNSTABLE FOR OUTFLOWS BETWEEN        0. TO        3.
                THE ROUTED HYDROGRAPH SHOULD BE EXAMINED FOR OSCILLATIONS OR OUTFLOWS GREATER THAN PEAK INFLOWS.
                THIS CAN BE CORRECTED BY DECREASING THE TIME INTERVAL OR INCREASING STORAGE (USE A LONGER REACH.)

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-SIYLE INPUT SIRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

Route Hydrograph Through Basin 23b Pipe

HYDROGRAPH ROUTING DATA

138 RK KINEMATIC WAVE STREAM ROUTING

L	1750.	CHANNEL LENGTH
S	.0140	SLOPE
N	.015	CHANNEL ROUGHNESS COEFFICIENT
CA	.00	CONTRIBUTING AREA
SHAPE	CIRC	CHANNEL SHAPE
WD	3.00	BOTTOM WIDTH OR DIAMETER
Z	.00	SIDE SLOPE
NDXMIN	2	MINIMUM NUMBER OF DX INTERVALS

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM
